## Worksheet: Speedup

## Array Sum Speedup

- •Assume T(S,P) = WORK(G,S)/P + CPL(G,S) = (S-1)/P + log2(S) for the parallel array sum computation shown in slide 4 (using the upper bound)
- •Assume S = 1024 ==> log 2(S) = 10

- •Compute for 10, 100, 1000 processors (round to 1 decimal place)  $T(S,P) = (S-1)/P + \log_2(S) = 1023/P + 10$ Speedup(10) = T(1)/T(10) =Speedup(100) = T(1)/T(100) =Speedup(1000) = T(1)/T(1000) =
- Why does the speedup not increase linearly in proportion to the number of processors?
