## COMP 322: Fundamentals of Parallel Programming

### Lecture 38: General-Purpose GPU (GPGPU) Computing

Guest Lecturer: Max Grossman Instructors: Vivek Sarkar, Mack Joyner Department of Computer Science, Rice University {jmg3, vsarkar, mjoyner}@rice.edu

http://comp322.rice.edu/

CO	MP	322

Lecture 38

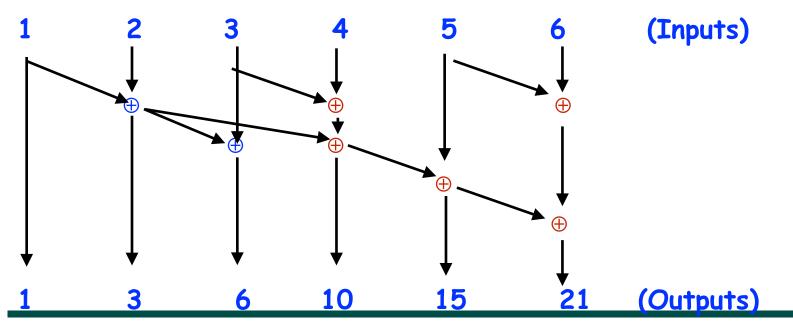

### Worksheet #37: Creating a Circuit for Parallel Prefix Sums

Name:

Netid: \_\_\_\_\_

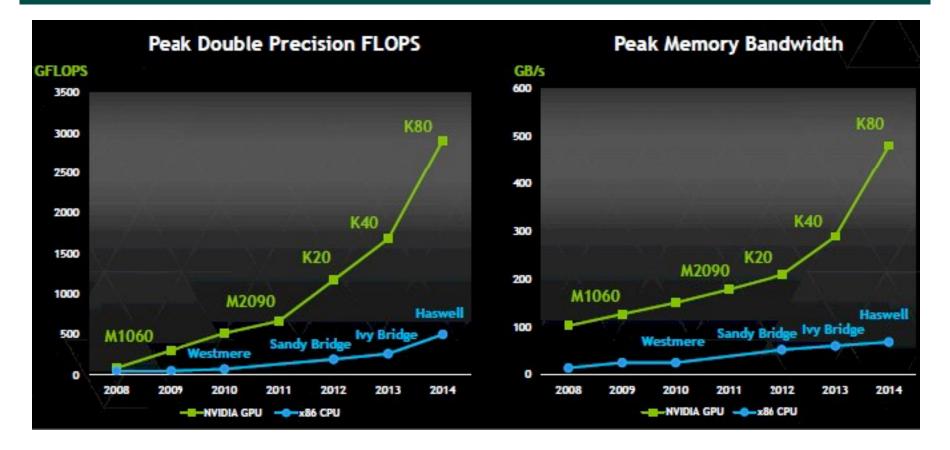

Assume that you have a full adder cell,  $\oplus$ , that can be used as a building block for circuits (no need to worry about carry's). Create a circuit that generates the prefix sums for 1, ... 6, by adding at most 5 more cells to the sketch shown below, while ensuring that the CPL is at most 3 cells long. Assume that you can duplicate any value (fan-out) to whatever degree you like without any penalty.

COMP 322, Spring 2017 (V. Sarkar, M. Joyner)

### Demo

 Performance gap between GPUs and multicore CPUs continues to widen

### So I Can Move Dots Around, So What?

- Google Use GPUs internally to train deep learning models (e.g. for NLP)
- USA Departments of Energy & Defense 3rd fastest supercomputer in the world based on GPUs, two of the next three supercomputers deployed by USA Department of Energy will be GPU based
- *Mayo Clinic* Using GPUs to improve tumor identification
- *Audi* Using GPUs for self-driving cars
- SpaceX Uses GPUs internally for combustion modeling of Merlin methane-based rocket
- Facebook Uses GPUs through their open source Caffe2 framework

### Flynn's Taxonomy for Parallel Computers

	Single Instruction	Multiple Instructions
Single Data	SISD	MISD
Multiple Data	SIMD	MIMD

Single Instruction, Single Data stream (SISD)

A sequential computer which exploits no parallelism in either the instruction or data streams. e.g., old single processor PC

### Single Instruction, Multiple Data streams (SIMD)

A computer which exploits multiple data streams against a single instruction stream to perform operations which may be naturally parallelized. e.g. graphics processing unit

### Multiple Instruction, Single Data stream (MISD)

Multiple instructions operate on a single data stream. Uncommon architecture which is generally used for fault tolerance. Heterogeneous systems operate on the same data stream and must agree on the result. e.g. the Space Shuttle flight control computer.

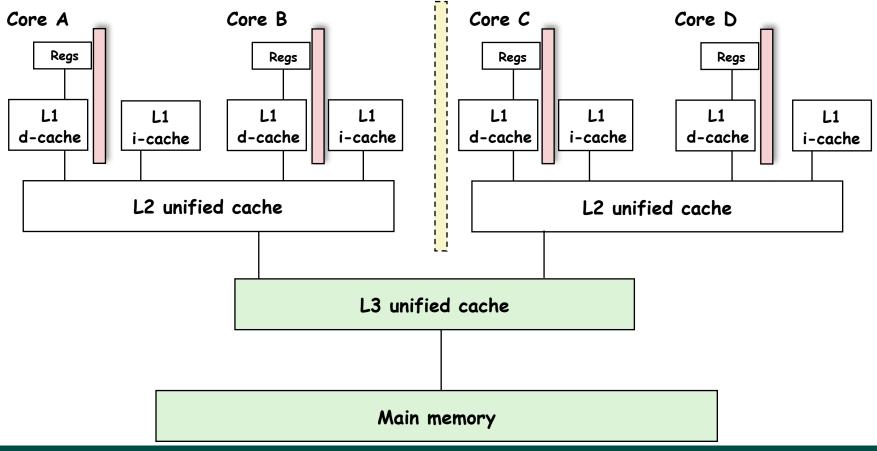

#### Multiple Instruction, Multiple Data streams (MIMD)

Multiple autonomous processors simultaneously executing different instructions on different data. e.g. a PC cluster memory space.

### Multicore Processors are examples of MIMD systems

 Memory hierarchy for a single Intel Xeon Quad-core E5530 processor chip

### **SIMD computers**

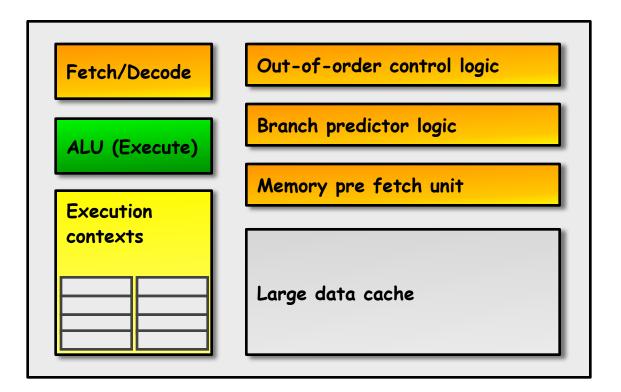

- Definition: A single instruction stream is applied to multiple data elements.
  - One program text
  - One instruction counter
  - Distinct data streams per Proc
- Examples: Vector Procs, GPUs

### "CPU-Style" Cores

The "CPU-Style" core is designed to make individual threads speedy.

"Execution context" == memory and hardware associated to a specific stream of instructions (e.g. a thread) Multiple cores lead to MIMD computers

### **GPU Design Idea #1: more slow cores**

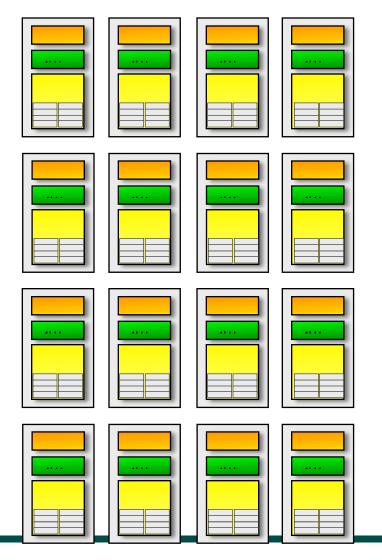

The first big idea that differentiates GPU and CPU core design: slim down the footprint of each core.

Fetch/Decode	
Execution contexts	Idea #1: Remove the modules that help a single instruction execute fast.

Slides and graphics based on presentations from <u>Andreas Klöckner</u> and <u>Kayvon Fatahalian</u>

### **GPU Design Idea #1: more slow cores**

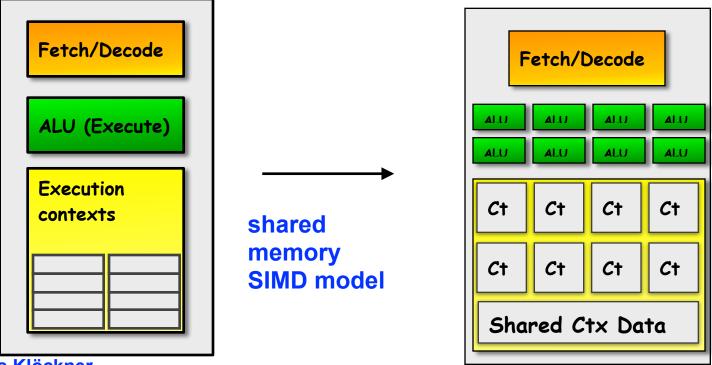

See: Andreas Klöckner and Kayvon Fatahalian

## GPU Design Idea #2: lock stepping

In the GPU rendering context, the instruction streams are typically very similar.

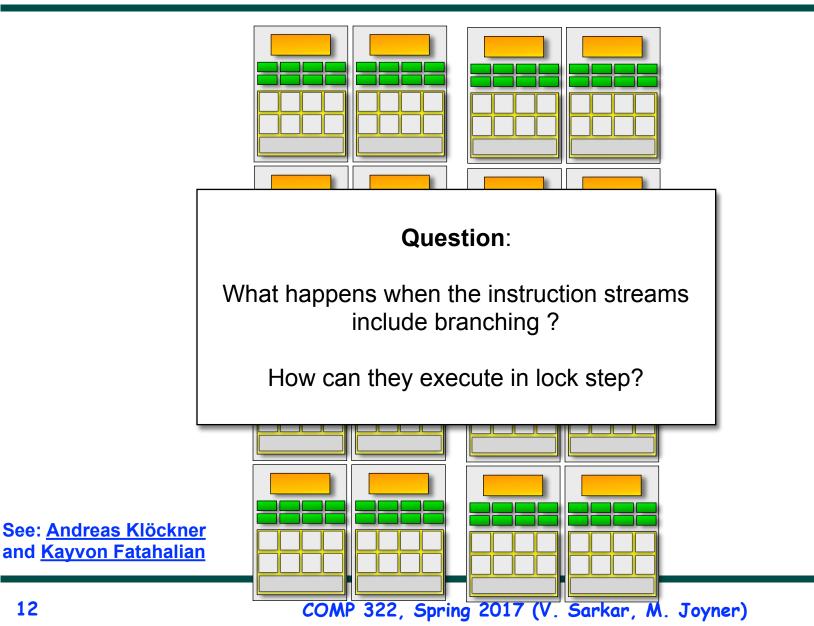

Design for a "single instruction multiple data" SIMD model: share the cost of the instruction stream across many ALUs (i.e. single program counter for multiple "cores")

See: Andreas Klöckner and Kayvon Fatahalian

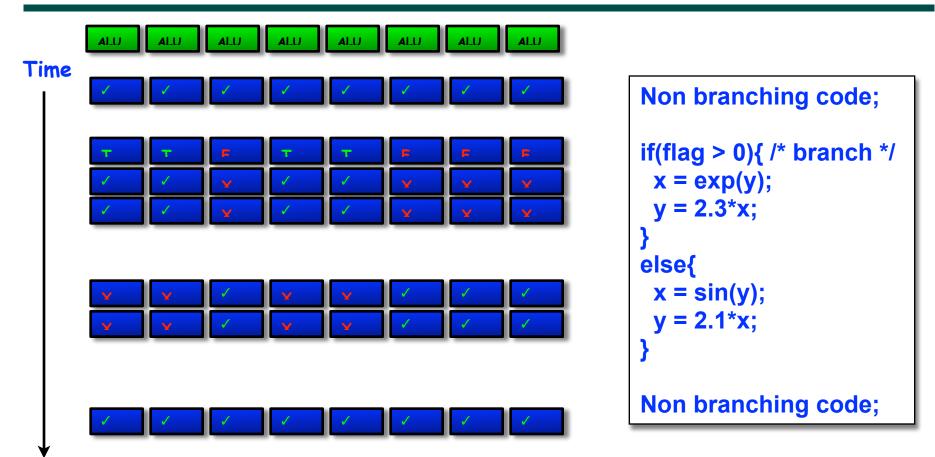

## **GPU Design Idea #2: branching ?**

### GPU Design Idea #2: lock stepping w/ branching

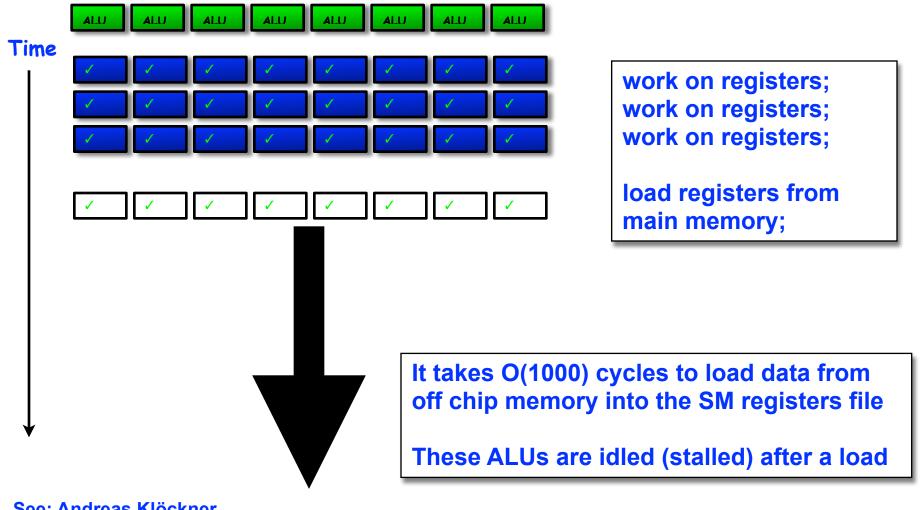

The cheap branching approach means that some ALUs are idle as all ALUs traverse all branches [ executing NOPs if necessary ]

In the worst possible case we could see 1/8 of maximum performance.

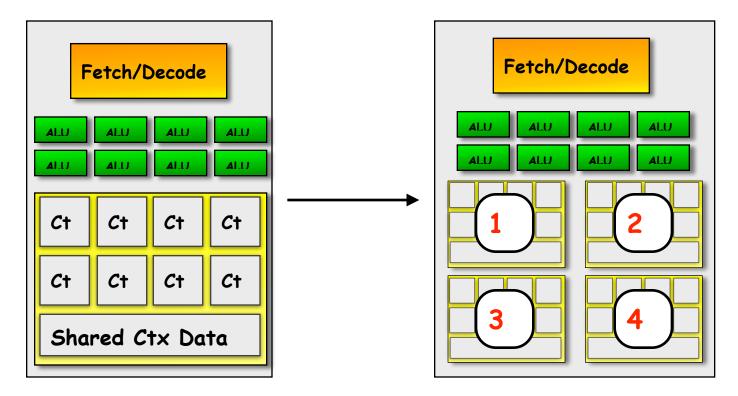

## **GPU Design Idea #3: latency hiding**

See: Andreas Klöckner and Kayvon Fatahalian

## **GPU Design Idea #3: latency hiding**

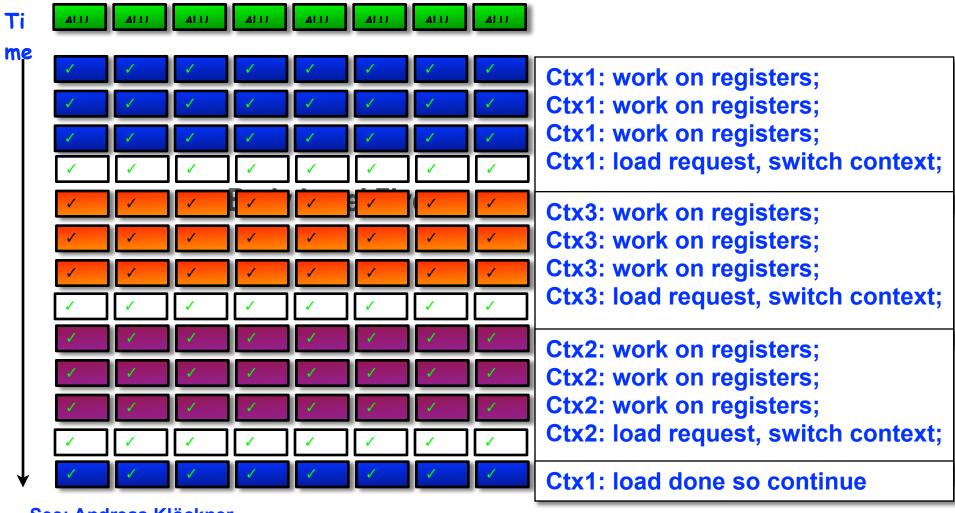

Idea #3: enable fast context switching so the ALUs can efficiently alternate between different tasks.

See: <u>Andreas Klöckner</u> and <u>Kayvon Fatahalian</u>

## GPU Design Idea #3: context switching

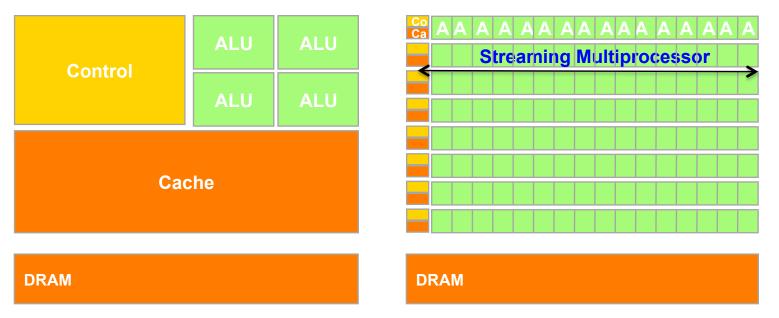

See: <u>Andreas Klöckner</u> and <u>Kayvon Fatahalian</u>

# Summary: CPUs and GPUs have fundamentally different design

### **GPU = Graphics Processing Unit**

### Single CPU core

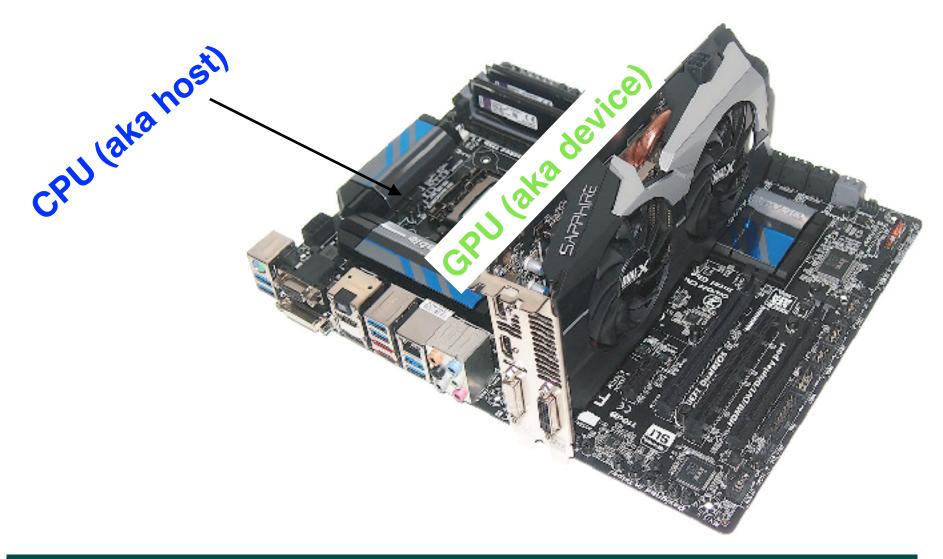

### **Multiple GPU processors**

GPUs are provided to accelerate graphics, but they can also be used for non-graphics applications that exhibit large amounts of data parallelism and require large amounts of "streaming" throughput  $\Rightarrow$  SIMD parallelism within an SM, and SPMD parallelism across SMs

### Host vs. Device

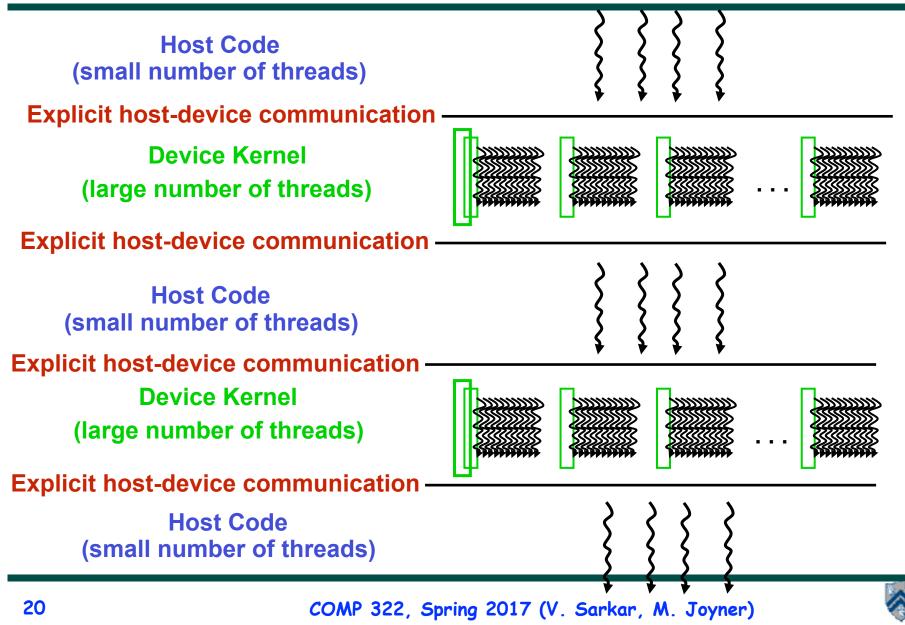

COMP 322, Spring 2017 (V. Sarkar, M. Joyner)

### Host vs. Device

- The GPU has its own independent memory space.
- The GPU brick is a separate compute sidecar.
- We refer to:
  - the GPU as a "DEVICE"
  - the CPU as the "HOST"
- An array that is in HOST-attached memory is not directly visible to the DEVICE, and vice versa.
- To load data onto the DEVICE from the HOST:
  - We allocate memory on the DEVICE for the array
  - We then copy data from the HOST array to the DEVICE array
- To retrieve results from the DEVICE they have to be copied from the DEVICE array to the HOST array.

### **Execution of a CUDA program**

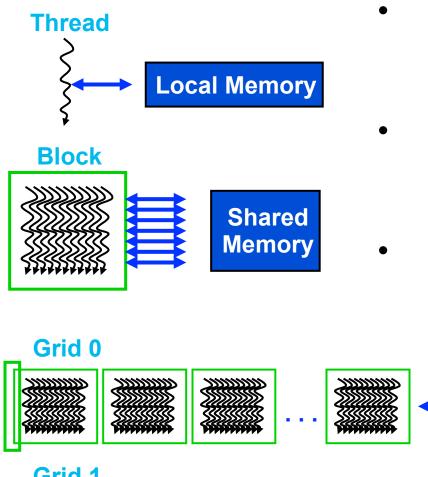

## **Outline of a CUDA main program**

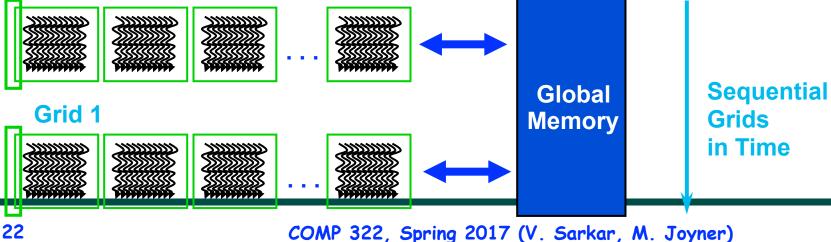

```
pseudo_cuda_code.cu:
 _global__ void kernel(arguments) {
  instructions for a single GPU thread;
}
. . .
main(){
set up GPU arrays;
copy CPU data to GPU;
kernel <<< # thread blocks, # threads per block >>> (arguments);
copy GPU data to CPU;
}
```

### CUDA Storage Classes + Thread Hierarchy

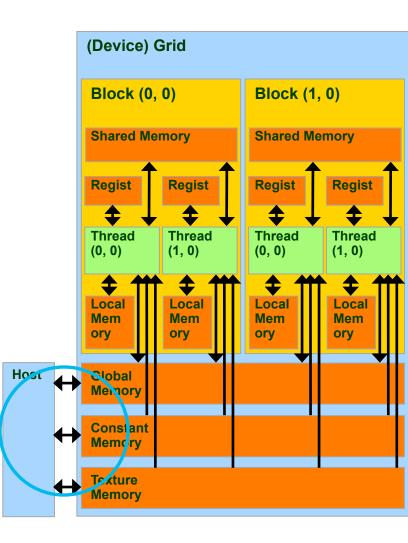

- Local Memory: per-thread
  - Private per thread
  - Auto variables, register spill
- Shared Memory: per-Block
  - Shared by threads of the same blo
  - Inter-thread communication
- Global Memory: per-application
  - Shared by all threads
  - Inter-Grid communication

## **CUDA Host-Device Data Transfer**

- cudaError\_t cudaMemcpy(void\* dst, const void\* src, size\_t count, enum cudaMemcpyKind kind)
- Copies count bytes from the memory area pointed to by src to the memory area pointed to by dst, where kind is one of
  - cudaMemcpyHostToHost
  - cudaMemcpyHostToDevice
  - cudaMemcpyDeviceToHost
  - cudaMemcpyDeviceToDevice
- The memory areas may not overlap
- Calling cudaMemcpy() with dst and src pointers that do not match the direction of the copy results in an undefined behavior.

# Matrix multiplication kernel code in CUDA --- SPMD model with 2D index

```
// Matrix multiplication kernel - thread specification
  global___ void MatrixMulKernel(float* Md, float* Nd, float* Pd, int Width)
  // 2D Thread ID
  int tx = threadIdx.x:
  int ty = threadIdx.y:
  // Pvalue stores the Pd element that is computed by the thread
  float Pvalue = 0:
  for (int k = 0: k < Width: ++k)
     float Mdelement = Md[ty * Width + k]:
     float Ndelement = Nd[k * Width + tx]:
     Pvalue += Mdelement * Ndelement:
  // Write the matrix to device memory each thread writes one element
  Pd[ty * Width + tx] = Pvalue;
```

### Host Code in C for Matrix Multiplication

1.	<pre>void MatrixMultiplication(float* M, float* N, float* P, int Width) {</pre>
2.	int size = Width*Width*sizeof(float); // matrix size
3.	float* Md, Nd, Pd; // pointers to device arrays
4.	<pre>cudaMalloc((void**)&amp;Md, size); // allocate Md on device</pre>
5.	<pre>cudaMemcpy(Md, M, size, cudaMemcpyHostToDevice); // copy M to Md</pre>
6.	<pre>cudaMalloc((void**)&amp;Nd, size); // allocate Nd on device</pre>
7.	<pre>cudaMemcpy(Nd, M, size, cudaMemcpyHostToDevice); // copy N to Nd</pre>
8.	<pre>cudaMalloc((void**)&amp;Pd, size); // allocate Pd on device</pre>
9.	<pre>dim3 dimBlock(Width,Width); dim3 dimGrid(1,1);</pre>
10.	<pre>// launch kernel (equivalent to "async at(GPU), forall, forall"</pre>
11.	MatrixMulKernel<< <dimgrid,dimblock>&gt;&gt;(Md, Nd, Pd, Width);</dimgrid,dimblock>
12.	<pre>cudaMemcpy(P, Pd, size, cudaMemcpyDeviceToHost); // copy Pd to P</pre>
13.	// Free device matrices
14.	<pre>cudaFree(Md) ; cudaFree(Nd) ; cudaFree(Pd) ;</pre>
15.	}

## Summary of key features in CUDA

CUDA construct	Related HJ/Java constructs
Kernel invocation, <<<<>>>	async at(gpu-place)
1D/2D grid with 1D/2D/3D blocks of threads	Outer 1D/2D forall with inner 1D/2D/3D forall
Intra-block barrier, syncthreads()	HJ forall-next on implicit phaser for inner forall
cudaMemcpy()	No direct equivalent in HJ/Java (can use System.arraycopy() if needed)
Storage classes: local, shared, global	No direct equivalent in HJ/Java (method-local variables are scalars)

### Worksheet #35: Branching in SIMD code

Name: \_\_\_\_\_

### Netid: \_\_\_\_\_

Consider SIMD execution of the following pseudocode with 8 threads. Assume that each call to doWork(x) takes x units of time, and ignore all other costs. How long will this program take when executed on 8 GPU cores, taking into consideration the branching issues discussed in Slide 9?

```
1. int tx = threadIdx.x; // ranges from 0 to 7
2. if (tx % 2 = 0) {
3. S1: doWork(1); // Computation S1 takes 1 unit of time
4. }
5. else {
6. S2: doWork(2); // Computation S2 takes 2 units of time
7. }
```

### **BACKUP SLIDES START HERE**

# HJ abstraction of a CUDA kernel invocation: async at + forall + forall
