COMP 322: Parallel and Concurrent Programming

Lecture 37: Concurrent and Parallel Languages and Frameworks

Mack Joyner
mjoyner@rice.edu

http://comp322.rice.edu
What have we learned in this course?

• Functional programming for parallelism
• Lazy computation, streams
• Futures and promises
• Data-driven programming approach
• Computation graphs and their properties
• Map/Reduce programming model
• Data-parallel programming model
• Loop parallelism
• Locality control
• Handling concurrency while avoiding deadlock/livelock/starvation
• Barrier and point-to-point synchronization
• Actor programming model
Habanero

- Habanero-Java and Habanero-C
- Async/finish, futures/promises, loop parallelism, phasers, locality control, actors, isolation
- HJlib is a library implementation of these features
- Still developed and improved
- Python, Kotlin, Go, X10, MPI, Chapel, Java, C/C++
- There’s also PCDP-Java
- Coursera equivalent of COMP 322
- No streams

https://habanero.cc.gatech.edu/
X10

- Designed and developed at IBM
- One of the original “Next-generation” Asynchronous Partitioned Global Address Space projects
- Ancestor of Habanero Java
- Async, finish, loop parallelism, clocks (phasers), locality control
- No abstract metrics, data-driven execution, actors, streams

http://x10-lang.org/
Chapel

- Designed, implemented and maintained by Cray
- Partitioned Global Address Space
- Loop parallelism, task parallelism
- Locality control
- Distributed system execution
- Tasks, futures, promises
- No phasers, actors, abstract metrics, data-driven execution

https://chapel-lang.org/
Kotlin

- From the creators of IntelliJ
- Based on Java
- Multi-paradigm programming language
  - Functional, object-oriented
- Lots of support for functional programing
- More compact than Java
- Fully interoperable with Java
- Support for coroutines: very similar to asyncs and future tasks
- Low-level synchronization between tasks
- Channels
- No loop parallelism, phasers, abstract metrics, streams, locality control, actors

https://kotlinlang.org/
Go

- Multi-paradigm, object-oriented, concurrent language
- Goroutines (asyncs)
- Channels
- Concurrency control structures
  - Sending messages between coroutines
- No phasers, loop parallelism, futures/promises, abstract metrics, actors, locality control

https://go.dev/
Python/Ray

- Library based approach
- Aimed at data science, machine learning, data processing
- Futures and actors
- No task-level parallelism on shared memory
- No abstract metrics, phasers, loop parallelism

https://www.ray.io/
MPI

- Library framework
- Message-passing programming model
- Designed for distributed systems
- Implementations on top of several programming languages
  - C/C++
  - Java
  - Fortran
  - Julia, MATLAB, OCaml, Python, R
- Implementations for most modern supercomputers
- No tasking, futures/promises, abstract metrics, streams, phasers
Summary

• Concurrent and parallel programming is becoming pervasive
• Many languages and frameworks support some aspects
• Most of them do not support all aspects of concurrent and parallel programming
• It’s possible to build additional features on top of a few basic ones
• You have learned most of the basic concepts in COMP 322
