COMP 322

Lecture 35

12 April 2017

Worksheet #34 solution: impact of distribution on parallel completion time (rather than locality)

```
1. public void sampleKernel(
2.     int iterations, int numChunks, Distribution dist) {
3.     for (int iter = 0; iter < iterations; iter++) {
4.         finish(() -> {
5.             forseq (0, numChunks - 1, (jj) -> {
6.                 asyncAt(dist.get(jj), () -> {
7.                     doWork(jj);
8.                     // Assume that time to process chunk jj = jj units
9.                 });
10.            });
11.        });
12.    } // for iter
13. } // sample kernel
```

- Assume an execution with n places, each place with one worker thread
- Will a block or cyclic distribution for $dist$ have a smaller abstract completion time, assuming that all tasks on the same place are serialized with one worker per place?

Answer: Cyclic distribution because it leads to better load balance (locality was not a consideration in this problem)

What is a “Eureka Style” Computation?

- Many optimization and search problems attempts to find a result with a certain property or cost
- Announce when a result has been found
 - An "aha!" moment – **Eureka** event
 - Can make rest of the computation unnecessary

==> Opportunities for “speculative parallelism”, e.g., Parallel Search, Branch and Bound Optimization, Soft Real-Time Deadlines, Convergence

Iterations, . . .

COMP 322, Spring 2017 (V. Sarkar, M. Joyner)

Simple Example: Search in a 2-D Matrix

```
1. class AsyncFinishSearch {
2.     AtomicReference atomicRefFactory() {
3.         // [x, y] is pseudocode syntax for specifying an integer pair
4.         return new AtomicReference([-1, -1])
5.     }
6.     int[] doWork(matrix, goal) {
7.         val token = atomicRefFactory()
8.         finish () -> {
9.             // How to break from a forasync loop?
10.            forasyncChunked (0, matrix.length - 1, (r) -> {
11.                procRow(matrix(r), r, goal, token)
12.            });
13.        });
14.        // return either [-1, -1] or valid index [i, j] matching goal
15.        return token.get()
16.    }
17.    void procRow(array, r, goal, token) {
18.        for (int c = 0; c < array.length(); c++)
19.            if goal.match(array(c)) // eureka!!!
20.                token.set([r, c])
21.            return
22.    }
}
```

Challenges in Parallelizing a Eureka-Style Computation

- Detecting eureka events
 - need to pass token around as extra argument
- Terminating executing tasks after eureka
 - manual termination via cancellation tokens can be a burden
 - throwing an exception does not terminate other parallel tasks
 - “killing” a parallel task can lead to unpredictable results (depending on when the task was terminated)

Example of Manual termination via Cancellation Tokens

- Manual periodic checks with returns
- User controls responsiveness

```
1.  class AsyncFinishManualSearch {
2.    int[] doWork(matrix, goal) {
3.      val token = atomicRefFactory()
4.      finish () -> {
5.        forasyncChunked (0, matrix.length - 1, (r) -> {
6.          if (token.get() != null)
7.            return
8.          procRow(matrix(r), r, goal, token)
9.        });
10.      }
11.      // [-1, -1] or valid index [i, j] matching goal
12.      return token.get()
13.    }
14.    void procRow(array, r, goal, token) {
15.      for (int c = 0; c < array.length(); c++)
16.        if (token.get() != null)
17.          return
18.        if goal.match(array(c)) // eureka!!!
19.          token.set([r, c])
20.        return
21.    }
}
```

- Cumbersome to write
- Impossible to support inaccessible functions

Repeated checks
which are written
manually

HJlib solution: the Eureka construct

1. eureka = eurekaFactory() // create Eureka object
 2. finish(eureka) S1 // register eureka w/ finish
 - Multiple finish's can register on same Eureka
 - Wait for all tasks to finish as before
 - Except that some tasks may terminate early when eureka is resolved
 3. async // task candidate for early termination
 - Inherits eureka registrations from immediately-enclosing finish
 4. offer()
 - Triggers eureka event on registered eureka
 5. check() // Like a "break" statement for a task
 - Causes task to terminate if eureka resolved
-

7

COMP 322, Spring 2017 (V. Sarkar, M. Joyner)

2D Matrix Search using Eureka construct (Pseudocode)

```
1. class AsyncFinishEurekaSearch {  
2.     HjEureka eurekaFactory() {  
3.         return ...  
4.     }  
5.     int[] doWork(matrix, goal) {  
6.         val eu = eurekaFactory()  
7.         finish(eu, () -> { // eureka registration  
8.             forasyncChunked(0, matrix.length - 1, (r) -> {  
9.                 procRow(matrix(r), r, goal)  
10.            });  
11.        });  
12.        // return either [-1, -1] or valid index [i, j] matching goal  
13.        return eu.get()  
14.    }  
15.    void procRow(array, r, goal) {  
16.        for (int c = 0; c < array.length(); c++)  
17.            check([r, c]) // cooperative termination check  
18.            if goal.match(array(c)) // eureka!!!  
19.                offer([r, c]) // trigger eureka event  
20.    } }
```

8

COMP 322, Spring 2017 (V. Sarkar, M. Joyner)

Eureka Variants (Pseudocode)

```
def eurekaFactory() {  
    val initialValue = [-1, -1]  
    return new SearchEureka(initialValue)  
}
```

```
def eurekaFactory() {  
    val K = 4  
    return new CountEureka(K)  
}
```

```
def eurekaFactory() {  
    // comparator to compare indices  
    val comparator = (a, b) -> {  
        ((a.x - b.x) == 0) ? (a.y - b.y) : (a.x - b.x)  
    }  
    val initialValue = [INFINITY, INFINITY]  
    return new MinimaEureka(initialValue, comparator)  
}
```

```
def eurekaFactory() {  
    val time = 4.seconds  
    return new TimerEureka(time)  
}
```

```
def eurekaFactory() {  
    val units = 400  
    return new EngineEureka(units)  
}
```

Binary Tree Search Example

Inputs:

- binary tree, T
- id for each node in T, in breadth-first order e.g., root.id = 0, root.left.id = 1, root.right.id = 2, ...
- value for each node in T that is the search target

Outputs:

- calls to offer() resolve eureka
- calls to check() can lead to early termination
- final value of eureka contains id of a node with value == elemToSearch

```
HjSearchEureka<Integer> eureka = newSearchEureka(null);  
finish(eureka, () -> {  
    async(() -> {  
        searchBody(eureka, rootNode, elemToSearch);  
    });  
});  
  
private static void searchBody(  
    HjSearchEureka<Integer> eureka, Node rootNode,  
    int elemToSearch) throws SuspendableException {  
    eureka.check(rootNode.id);  
    if (rootNode.value == elemToSearch) {  
        eureka.offer(rootNode.id);  
    }  
    if (rootNode.left != null) {  
        async(() -> {  
            searchBody(eureka, rootNode.left, elemToSearch);  
        });  
    }  
    if (rootNode.right != null) {  
        async(() -> {  
            searchBody(eureka, rootNode.right, elemToSearch);  
        });  
    }  
}
```

Tree Min Index Search Example

Inputs:

- binary tree, T
- id for each node in T, in breadth-first order e.g., root.id = 0, root.left.id = 1, root.right.id = 2, ...
- value for each node in T that is the search target

Outputs:

- calls to offer() update eureka with minimum id found so far (among those that match)
- calls to check() can lead to early termination if the argument is \geq current minimum in eureka
- final value of eureka contains minimum id of node with value == elemToSearch

```
HjExtremaEureka<Integer> eureka = newExtremaEureka(
    Integer.MAX_VALUE, (Integer i, Integer j) -> j.compareTo(i));
finish(eureka, () -> {
    async(() -> {
        minIndexSearchBody(eureka, rootNode, elemToSearch);
    });
});

private static void minIndexSearchBody(
    HjExtremaEureka<Integer> eureka, Node rootNode,
    int elemToSearch) throws SuspendableException {
    eureka.check(rootNode.id);
    if (rootNode.value == elemToSearch) {
        eureka.offer(rootNode.id);
    }
    if (rootNode.left != null) {
        async(() -> {
            minIndexSearchBody(eureka, rootNode.left, elemToSearch);
        });
    }
    if (rootNode.right != null) {
        async(() -> {
            minIndexSearchBody(eureka, rootNode.right, elemToSearch);
        });
    }
}
```

AND-composition of Eurekas

```
1. class AsyncFinishEurekaDoubleSearch {
2.     int[] doWork(matrix, goal) {
3.         val eul = eurekaFactory()
4.         val eu2 = eurekaFactory()
5.         val eu = eurekaComposition(AND, eul, eu2)
6.         finish (eu, () -> { // eureka registration
7.             forasyncChunked (0, matrix.length - 1, (r) -> {
8.                 procRow(matrix(r), r, goal1, goal2)
9.             });
10.        });
11.        // return either [-1, -1] or valid index [i, j] matching goal
12.        return eu.get()
13.    }
14.    void procRow(array, r, goal) {
15.        for (int c = 0; c < array.length(); c++)
16.            val checkArg = [[r, c], [r, c]]
17.            check(checkArg) // cooperative termination check
18.            val loopElem = array(c)
19.            val res1 = g1.match(loopElem) ? [r, c] : null
20.            val res2 = g2.match(loopElem) ? [r, c] : null
21.            val foundIdx = [res1, res2] // pair of values for eul and eu2
22.            offer(foundIdx) // possible eureka event
23.    }
}
```
