Worksheet #21a solution: Abstract Metrics with Object-based Isolated Constructs

Q: Compute the WORK and CPL metrics for this program with a global isolated construct. Indicate if your answer depends on the execution order of isolated constructs.

```
1.    finish(() -> {
2.        for (int i = 0; i < 5; i++) {
3.            async(() -> {
4.                doWork(2);
5.                isolated(() -> { doWork(1); });
6.                doWork(2);
7.            }); // async
8.        } // for
9.   }); // finish
```

Answer: WORK = 25, CPL = 9. These metrics do not depend on the execution order of isolated constructs.

Worksheet #21b solution: Abstract Metrics with Isolated Constructs

Q: Compute the WORK and CPL metrics for this program with an object-based isolated construct. Indicate if your answer depends on the execution order of isolated constructs.

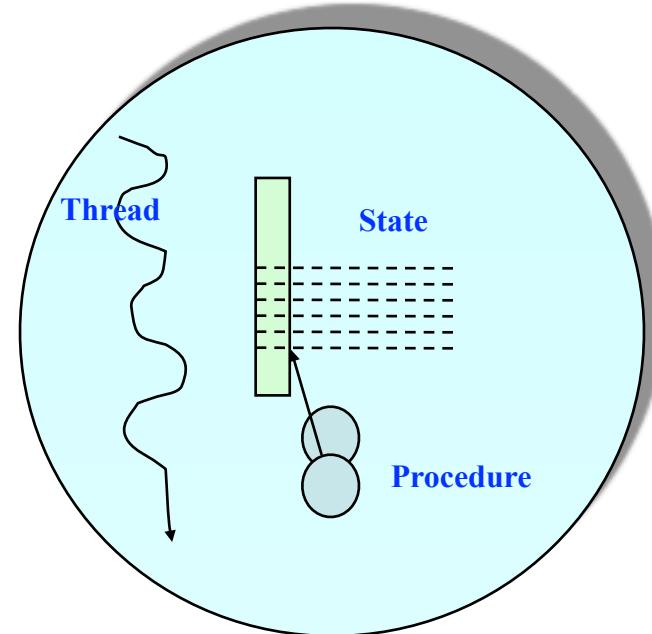

```
1.    finish(() -> {
2.        // Assume X is an array of distinct objects
3.        for (int i = 0; i < 5; i++) {
4.            async(() -> {
5.                doWork(2);
6.                isolated(X[i], X[i+1],
7.                          () -> { doWork(1); });
8.                doWork(2);
9.            }); // async
10.        } // for
11.    }); // finish
```

Answer: WORK = 25, CPL = 7. These metrics do not depend on the execution order of object-based isolated constructs.

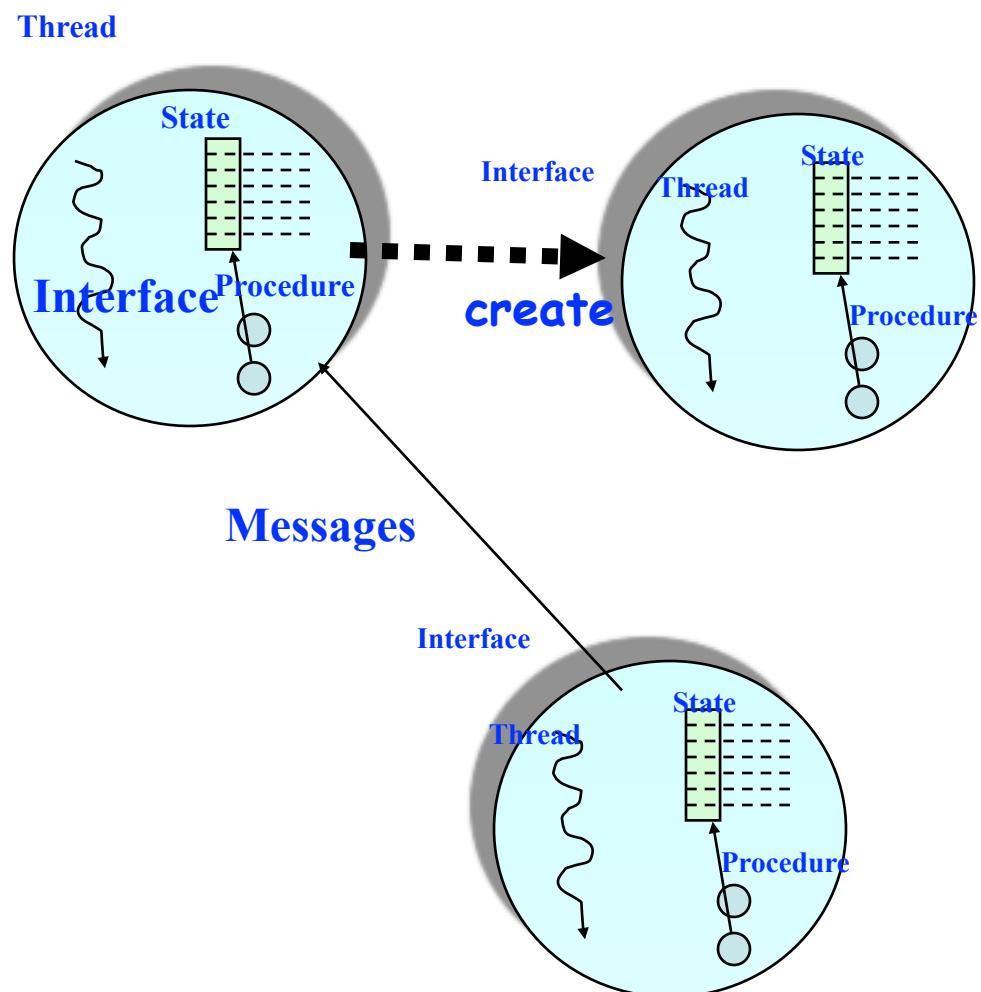

Actors: an alternative approach to isolation

- An actor is an autonomous, interacting component of a parallel system.
- An actor has:
 - an immutable identity (global reference)
 - a *single logical thread of control*
 - mutable local state (isolated by default)
 - procedures to manipulate local state (interface)

The Actor Model: Fundamentals

- An actor may:
 - process messages
 - change local state
 - create new actors
 - send messages

Actor Model

- A message-based concurrency model to manage mutable shared state
 - First defined in 1973 by Carl Hewitt
 - Further theoretical development by Henry Baker and Gul Agha
- Key Ideas:
 - Everything is an Actor!
 - Analogous to “everything is an object” in OOP
 - Encapsulate shared state in Actors
 - Mutable state is not shared - i.e., no data races
- Other important features
 - Asynchronous message passing
 - Non-deterministic ordering of messages

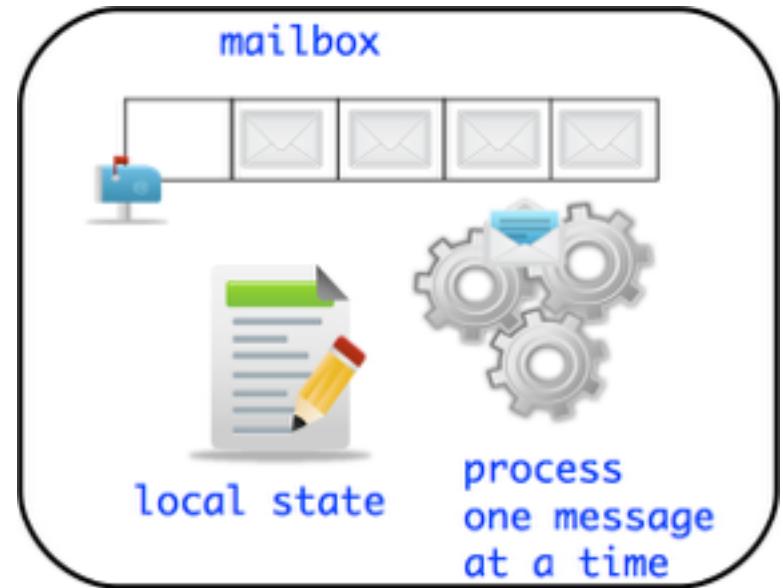

Actor Life Cycle

Actor states

- **New:** Actor has been created
 - e.g., email account has been created, messages can be received
- **Started:** Actor can process messages
 - e.g., email account has been activated
- **Terminated:** Actor will no longer processes messages
 - e.g., termination of email account after graduation

Actor Analogy - Email

- Email accounts are a good simple analogy to Actors
- Account A2 can send information to account A1 via an email message
- A1 has a mailbox to store all incoming messages
- A1 can read (i.e. process) one email at a time
 - At least that is what normal people do :)
- Reading an email can change how you respond to a subsequent email
 - e.g. receiving pleasant news while reading current email can affect the response to a subsequent email
- Actor creation (stretching the analogy)
 - Create a new email account that can send/receive messages

Using Actors in HJlib

- Create your custom class which extends `edu.rice.hj.runtime.actors.Actor<T>`, and implement the void `process()` method (type parameter T specifies message type)

```
class MyActor extends Actor<T> {  
    protected void process(T message) {  
        println("Processing " + message);  
    } }
```

- Instantiate and start your actor

```
Actor<Object> anActor = new MyActor();  
anActor.start()
```

- Send messages to the actor (can be performed by actor or non-actor)

```
anActor.send(aMessage); //aMessage can be any object in general
```

- Use a special message to terminate an actor

```
protected void process(Object message) {  
    if (message.someCondition()) exit();  
}
```

- Actor execution implemented as async tasks

Can use `finish` to await completion of an actor,
if the actor is started inside the `finish`.

Summary of HJlib Actor API

```
void process(MessageType theMsg) // Specification of actor's "behavior" when processing messages
```

```
void send(MessageType msg) // Send a message to the actor
```

```
void start() // Cause the actor to start processing messages
```

```
void onPreStart() // Convenience: specify code to be executed before actor is started
```

```
void onPostStart() // Convenience: specify code to be executed after actor is started
```

```
void exit() // Actor calls exit() to terminate itself
```

```
void onPreExit() // Convenience: specify code to be executed before actor is terminated
```

```
void onPostExit() // Convenience: specify code to be executed after actor is terminated
```

// Later today

```
void pause() // Pause the actor, i.e. the actors stops processing messages in its mailbox
```

```
void resume() // Resume a paused actor, i.e. actor resumes processing messages in mailbox
```

See <http://www.cs.rice.edu/~vs3/hjlib/doc/edu/rice/hj/runtime/actors/Actor.html> for details

Hello World Example

```
1. public class HelloWorld {  
2.     public static void main(final String[] args) {  
3.         finish(()-> {  
4.             EchoActor actor = new EchoActor();  
5.             actor.start(); // don't forget to start the actor  
6.             actor.send("Hello"); // asynchronous send (returns immediately)  
7.             actor.send("World"); // Non-actors can send messages to actors  
8.             actor.send(EchoActor.STOP_MSG);  
9.         });  
10.        println("EchoActor terminated.")  
11.    }  
12.    private static class EchoActor extends Actor<Object> {  
13.        static final Object STOP_MSG = new Object();  
14.        private int messageCount = 0;  
15.        protected void process(final Object msg) {  
16.            if (STOP_MSG.equals(msg)) {  
17.                println("Message- " + messageCount + ": terminating.");  
18.                exit(); // never forget to terminate an actor  
19.            } else {  
20.                messageCount += 1;  
21.                println("Message- " + messageCount + ": " + msg);  
22.            } } } }
```

Though sends are asynchronous, many actor libraries (including HJlib) preserve the order of messages between the same sender actor/task and the same receiver actor

Integer Counter Example

Without Actors:

```
1. int counter = 0;
2. public void foo() {
3.     // do something
4.     isolated(() -> {
5.         counter++;
6.     });
7.     // do something else
8. }
9. public void bar() {
10.    // do something
11.    isolated(() -> {
12.        counter--;
13.    });
14. }
```

- Can also use atomic variables instead of isolated construct

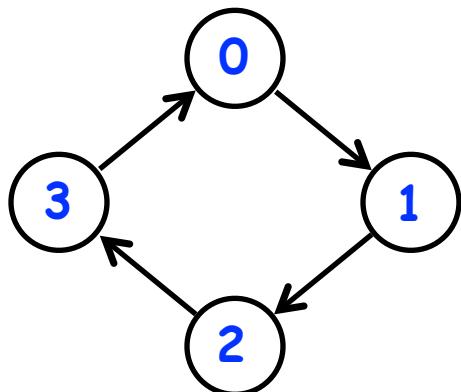

With Actors:

```
15. class Counter extends Actor<Message> {
16.     private int counter = 0; // local state
17.     protected void process(Message msg) {
18.         if (msg instanceof IncMessage) {
19.             counter++;
20.         } else if (msg instanceof DecMessage) {
21.             counter--;
22.         }
23.     }
24.     Counter counter = new Counter();
25.     counter.start();
26.     public void foo() {
27.         // do something
28.         counter.send(new IncrementMessage(1));
29.         // do something else
30.     }
31.     public void bar() {
32.         // do something
33.         counter.send(new DecrementMessage(1));
34.     }
}
```

ThreadRing (Coordination) Example

```
1. finish() -> {
2.     int threads = 4;
3.     int numberOfHops = 10;
4.     ThreadRingActor[] ring =
5.         new ThreadRingActor[threads];
6.     for(int i=threads-1;i>=0; i--) {
7.         ring[i] = new ThreadRingActor(i);
8.         ring[i].start();
9.         if (i < threads - 1) {
10.             ring[i].nextActor(ring[i + 1]);
11.         } }
12.     ring[threads-1].nextActor(ring[0]);
13.     ring[0].send(numberOfHops);
14. }; // finish
```

```
14. class ThreadRingActor
15.     extends Actor<Integer> {
16.     private Actor<Integer> nextActor;
17.     private final int id;
18.     ...
19.     public void nextActor(
20.         Actor<Object> nextActor) {...}

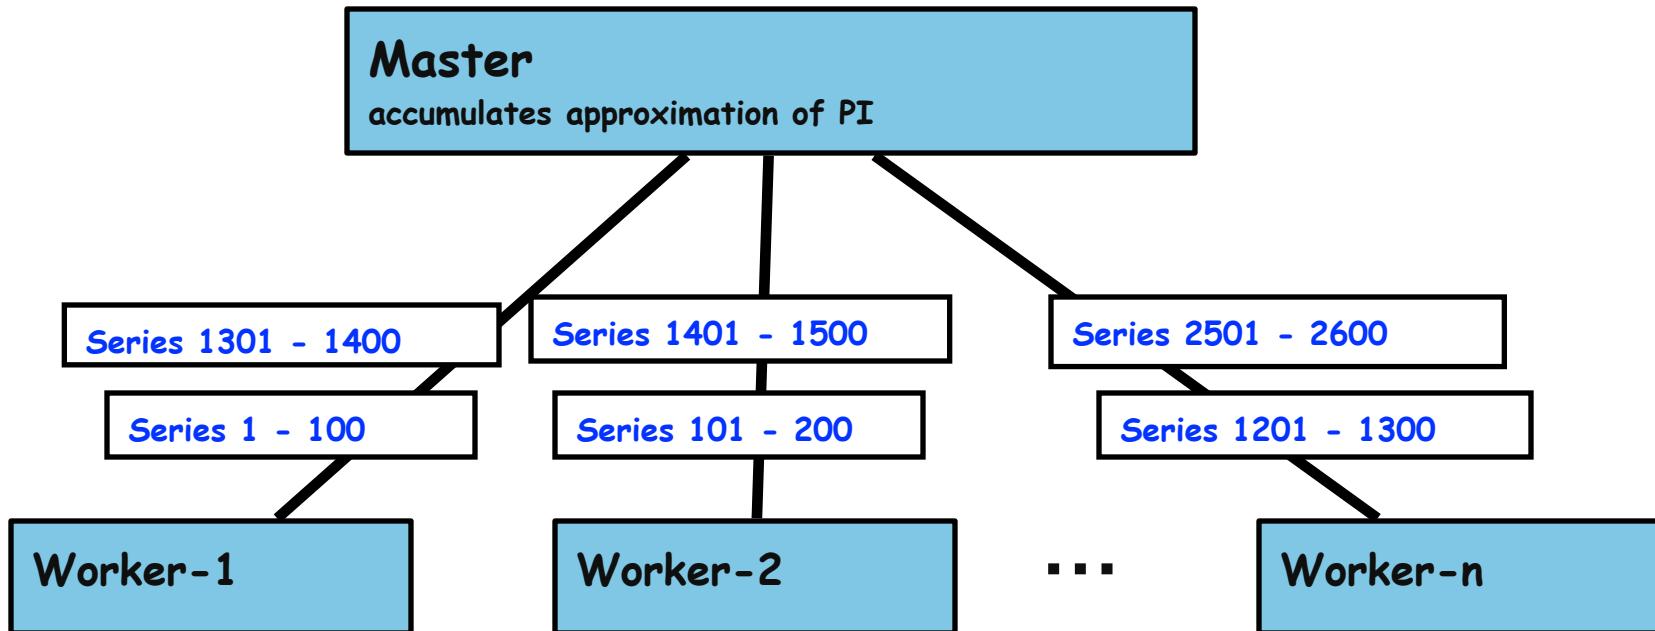

21.     protected void process(Integer n) {
22.         if (n > 0) {
23.             println("Thread-" + id +
24.                 " active, remaining = " + n);
25.             nextActor.send(n - 1);
26.         } else {
27.             println("Exiting Thread-" + id);
28.             nextActor.send(-1);
29.             exit();
30.     } } }
```

Pi Computation Example

$$\pi = 4 \sum_{k=0}^{\infty} \frac{(-1)^k}{2k+1} = \frac{4}{1} - \frac{4}{3} + \frac{4}{5} - \frac{4}{7} + \frac{4}{9} - \dots$$

- Use Master-Worker technique:

Source: <http://www.enotes.com/topic/Pi>

Pi Calculation --- Master Actor

```
1. class Master extends Actor<Object> {
2.     private double result = 0; private int nrMsgsReceived = 0;
3.     private Worker[] workers;
4.     Master(nrWrkrs, nrEls, nrMsgs) {...} // constructor
5.     protected void onPostStart() {
6.         // Create and start workers
7.         workers = new Worker[nrWrkrs];
8.         for (int i = 0; i < nrwrkrs; i++) {
9.             workers[i] = new Worker();
10.            workers[i].start();
11.        }
12.        // Send messages to workers
13.        for (int j = 0; j < nrMsgs; j++) {
14.            someWrkr = ... ; // Select worker for message j
15.            someWrkr.send(new Work(...));
16.        }
17.    } // start()
```

Pi Calculation --- Master Actor (contd)

```
19.     protected void onPostExit() {
20.         for (int i = 0; i < nrWrkrs; i++)
21.             workers[i].send(new Stop());
22.     } // post-exit()
23.     protected void process(final Object msg) {
24.         if (msg instanceof Result) {
25.             result += ((Result) msg).result;
26.             nrMsgsReceived += 1;
27.             if (nrMsgsReceived == nrMsgs) exit();
28.         }
29.         // Handle other message cases here
30.     } // process()
31. } // Master
32. . . .
33. // Main program
34. Master master = new Master(w, e, m);
35. finish(() -> { master.start(); });
36. println("PI = " + master.getResult());
```

Pi Calculation --- Worker Actor

```
1.  class Worker extends Actor<Object> {
2.      protected void process(final Object msg) {
3.          if (msg instanceof Stop)
4.              exit();
5.          else if (msg instanceof Work) {
6.              Work wm = (Work) msg;
7.              double result = calculatePiFor(wm.start, wm.end)
8.              master.send(new ResultMessage(result));
9.          } } // process()
10.
11.     private double calculatePiFor(int start, int end) {
12.         double acc = 0.0;
13.         for (int k = start; k < end; k++) {
14.             acc += 4.0 * (1 - (k % 2) * 2) / (2 * k + 1);
15.         }
16.         return acc;
17.     }
18. } // Worker
```

$$4 \sum_{k=1}^{e-1} \frac{(-1)^k}{2k+1}$$

Limitations of Actor Model

- **Deadlocks possible**
 - Deadlock occurs when all started (but non-terminated) actors have empty mailboxes
- **Data races possible when messages include shared objects**
- **Simulating synchronous replies requires some effort**
 - e.g., does not support `addAndGet()`
- **Implementing truly concurrent data structures is hard**
 - No parallel reads, no reductions/accumulators
- **Difficult to achieve global consensus**
 - Finish and barriers not supported as first-class primitives

==> Some of these limitations can be overcome by using a hybrid model that combines task parallelism with actors (more on this in the next lecture!)

Worksheet #22:

Interaction between finish and actors

Name: _____

Net ID: _____

What output will be printed if the end-finish operation from slide 13 is moved from line 13 to line 11 as shown below?

```
1.  finish(() -> {
2.      int threads = 4;
3.      int numberOfHops = 10;
4.      ThreadRingActor[] ring = new ThreadRingActor[threads];
5.      for(int i=threads-1;i>=0; i--) {
6.          ring[i] = new ThreadRingActor(i);
7.          ring[i].start();
8.          if (i < threads - 1) {
9.              ring[i].nextActor(ring[i + 1]);
10.         } }
11.     }); // finish
12.     ring[threads-1].nextActor(ring[0]);
13.     ring[0].send(numberOfHops);
14.
```
