Worksheet #5: Computation Graphs for Async-Finish and Future Constructs

1) Can you write pseudocode with async-finish constructs that generates a Computation Graph with the same ordering constraints as the graph on the right? If so, provide a sketch of the program.

No. Finish cannot be used to ensure that D only waits for B and C, while E waits only for C.

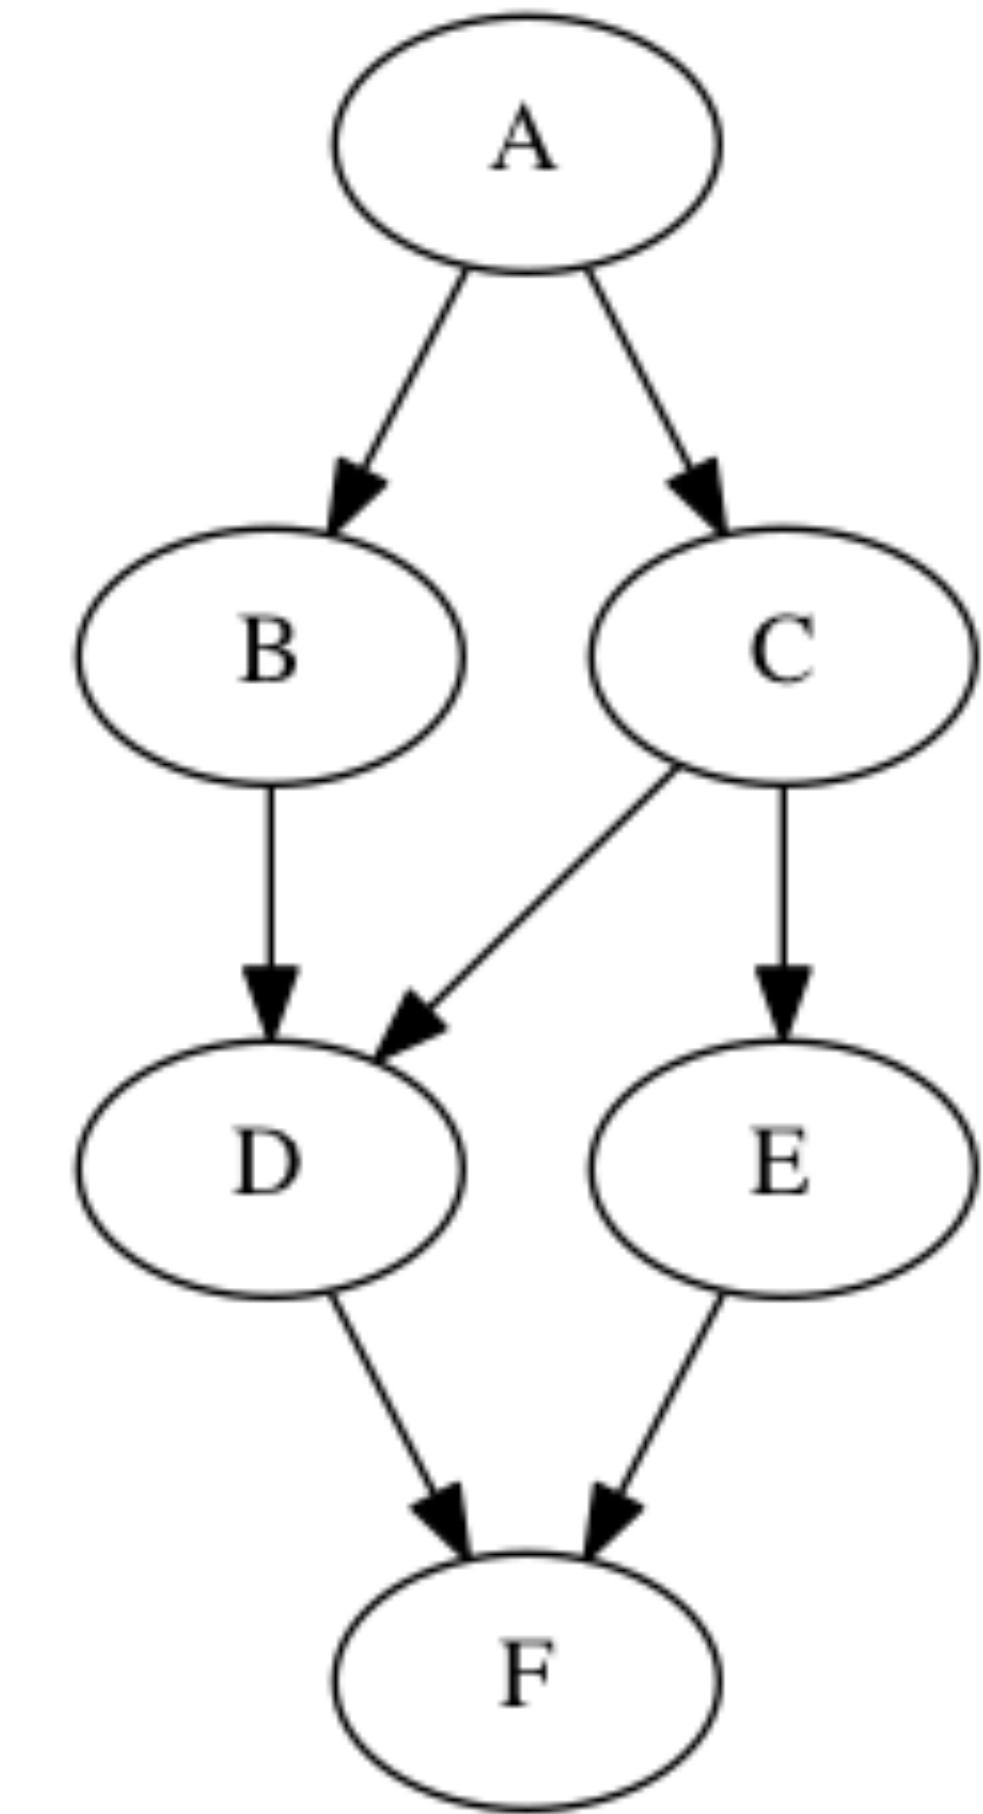

2) Can you write pseudocode with future async-get constructs that generates a Computation Graph with the same ordering constraints as the graph on the right? If so, provide a sketch of the program.

Yes, see program sketch with dummy return values.

Worksheet #5 solution (contd)

```
1. HjFuture<String> A = future( () -> {  
2.     return "A"; } );  
3. HjFuture<String> B = future( () -> {  
4.     A.get(); return "B"; } );  
5. HjFuture<String> C = future( () -> {  
6.     A.get(); return "C"; } );  
7. HjFuture<String> D = future( () -> {  
8.     // Order of B.get() & C.get() doesn't matter  
9.     B.get(); C.get(); return "D"; } );  
10. HjFuture<String> E = future( () -> {  
11.     C.get(); return "E"; } );  
12. HjFuture<String> F = future( () -> {  
13.     D.get(); E.get(); return "F"; } );  
14. F.get();
```

Comparing Async-Finish with Future-Get

- Similarities:
 - Finish and Get can be used to synchronize and avoid data races
 - Finish waits for both async and future tasks
- Differences:
 - Async supports side effects, Futures have return values
 - Future gets can model a larger set of computation graphs than async-finish
 - Finish can wait for an unbounded set of tasks (determined at runtime)

Extending Finish Construct with “Finish Accumulators” (Pseudocode)

- Creation

```
accumulator ac = newFinishAccumulator(operator, type);
```

- *Operator must be associative and commutative (creating task “owns” accumulator)*

- Registration

```
finish (ac1, ac2, ...) { ... }
```

- *Accumulators ac1, ac2, ... are registered with the finish scope*

- Accumulation

```
ac.put(data);
```

- *Can be performed in parallel by any statement in finish scope that registers ac. Note that a put contributes to the accumulator, but does not overwrite it.*

- Retrieval

```
ac.get();
```

- *Returns initial value if called before end-finish, or final value after end-finish*

- *get() is nonblocking because no synchronization is needed (finish provides the necessary synchronization)*

Example: count occurrences of pattern in text (sequential version)

```
1. // Count all occurrences
2. int count = 0;
3. {
4.     for (int ii = 0; ii <= N - M; ii++) {
5.         int i = ii;
6.         // search for match at position i
7.         for (j = 0; j < M; j++)
8.             if (text[i+j] != pattern[j]) break;
9.         if (j == M) count++; // Increment count
10.    } // for-ii
11. }
12. }
13. print count; // Output
```

Example: count occurrences of pattern in text (parallel version using finish accumulator)

```
1. // Count all occurrences
2. a = new Accumulator(SUM, int)
3. finish(a) {
4.   for (int ii = 0; ii <= N - M; ii++) {
5.     int i = ii;
6.     async { // search for match at position i
7.       for (j = 0; j < M; j++)
8.         if (text[i+j] != pattern[j]) break;
9.       if (j == M) a.put(1); // Increment count
10.    } // async
11. }
12. } // finish
13. print a.get(); // Output
```

Error Conditions with Finish Accumulators

1. Non-owner task cannot access accumulator outside registered finish

```
// T1 allocates accumulator a  
accumulator a = newFinishAccumulator(...);  
a.put(1); // T1 can access a  
async { // T2 cannot access a  
    a.put(1); Number v1 = a.get();  
}
```

2. Non-owner task cannot register accumulator with a finish

```
// T1 allocates accumulator a  
accumulator a = newFinishAccumulator(...);  
async {  
    // T2 cannot register a with finish  
    finish (a) { async a.put(1); }  
}
```

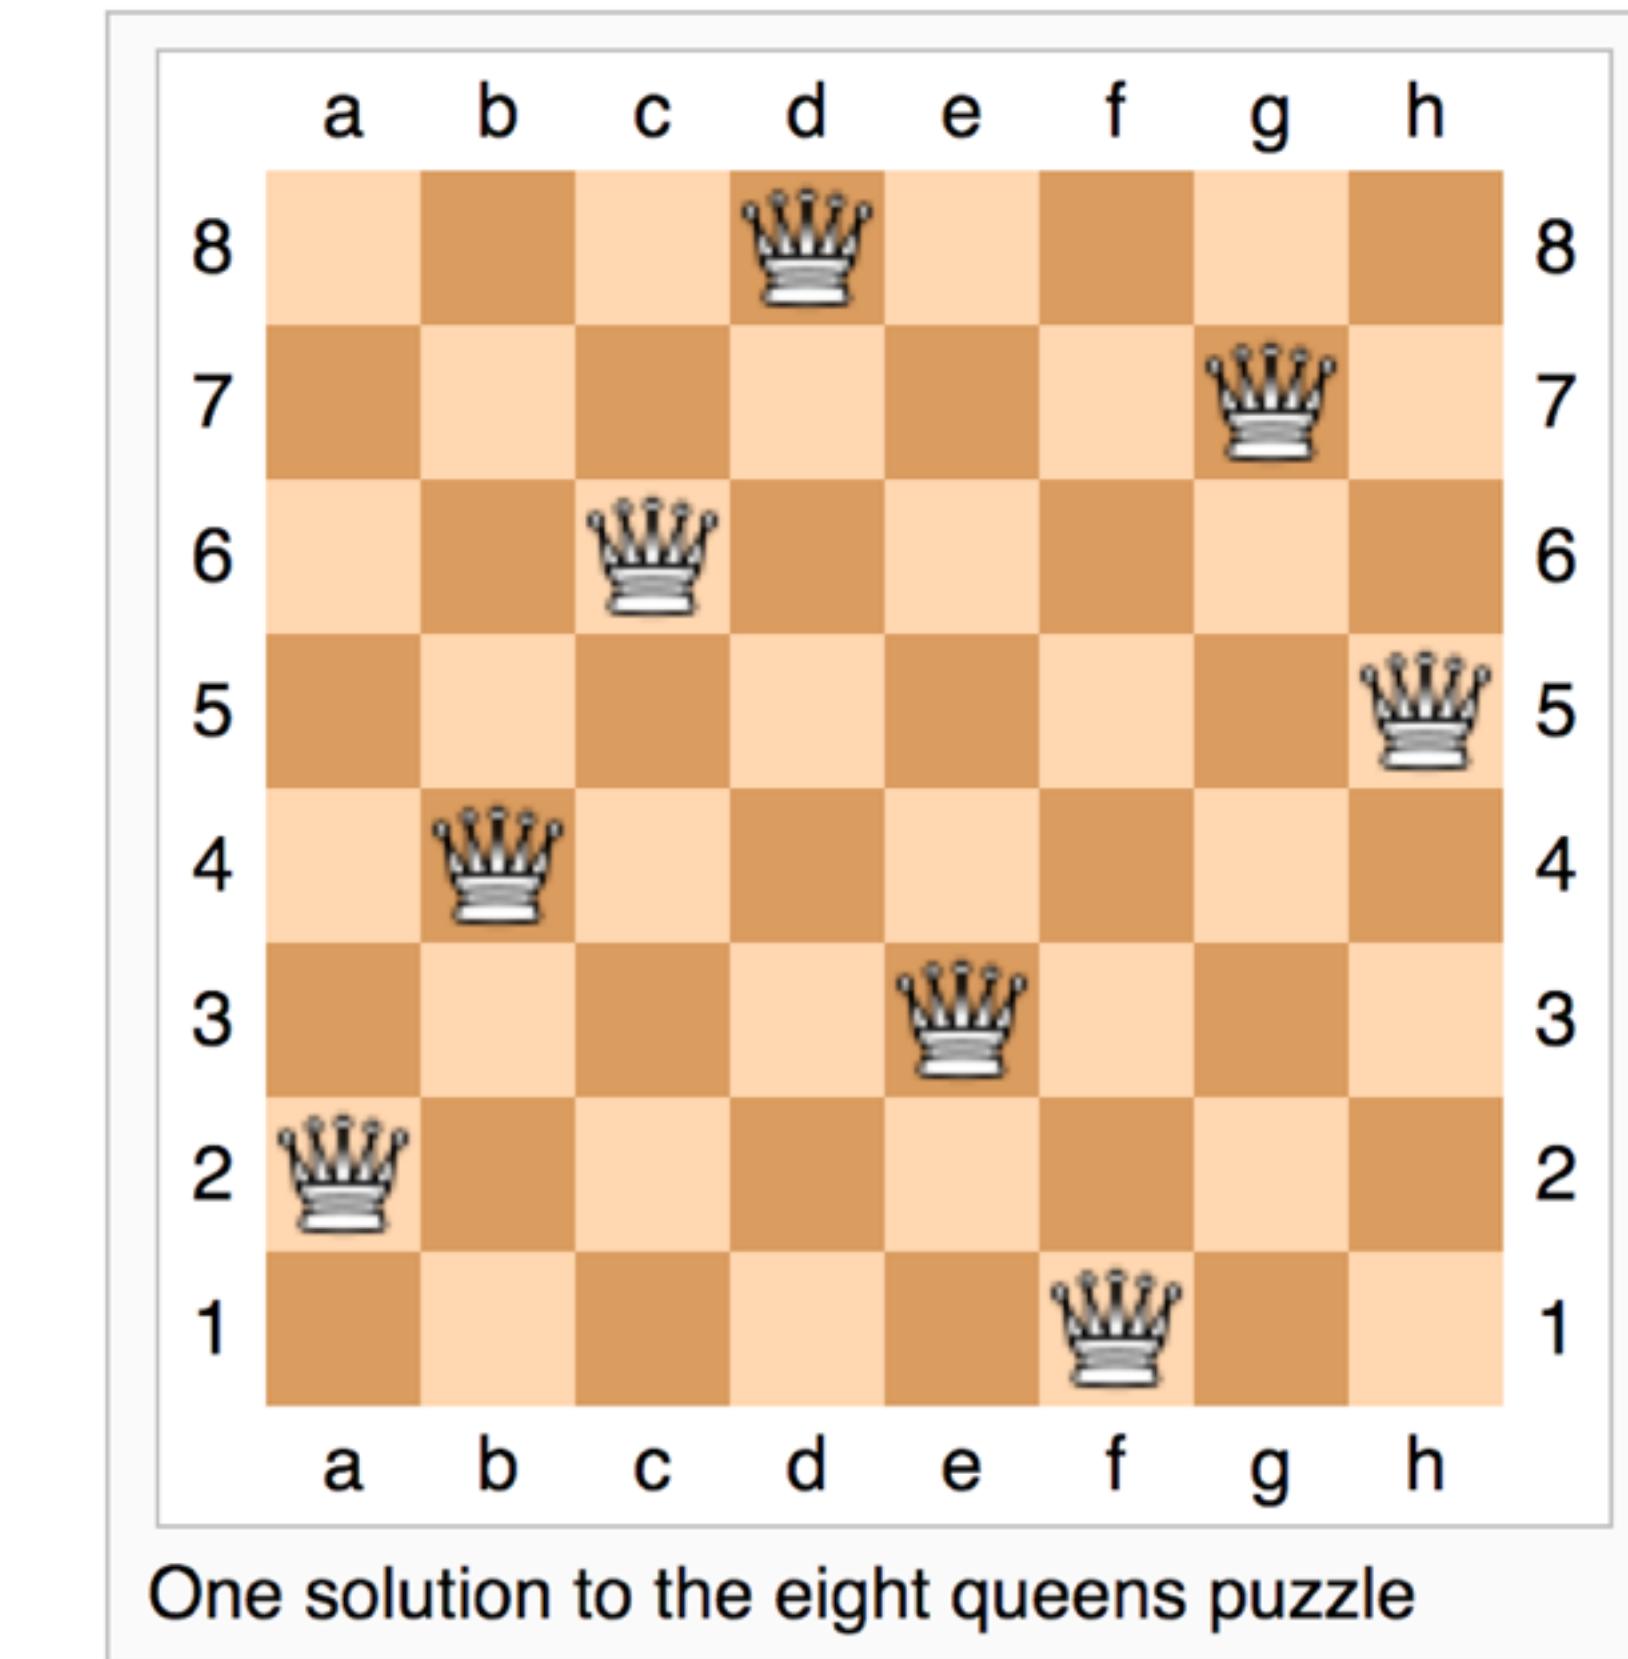

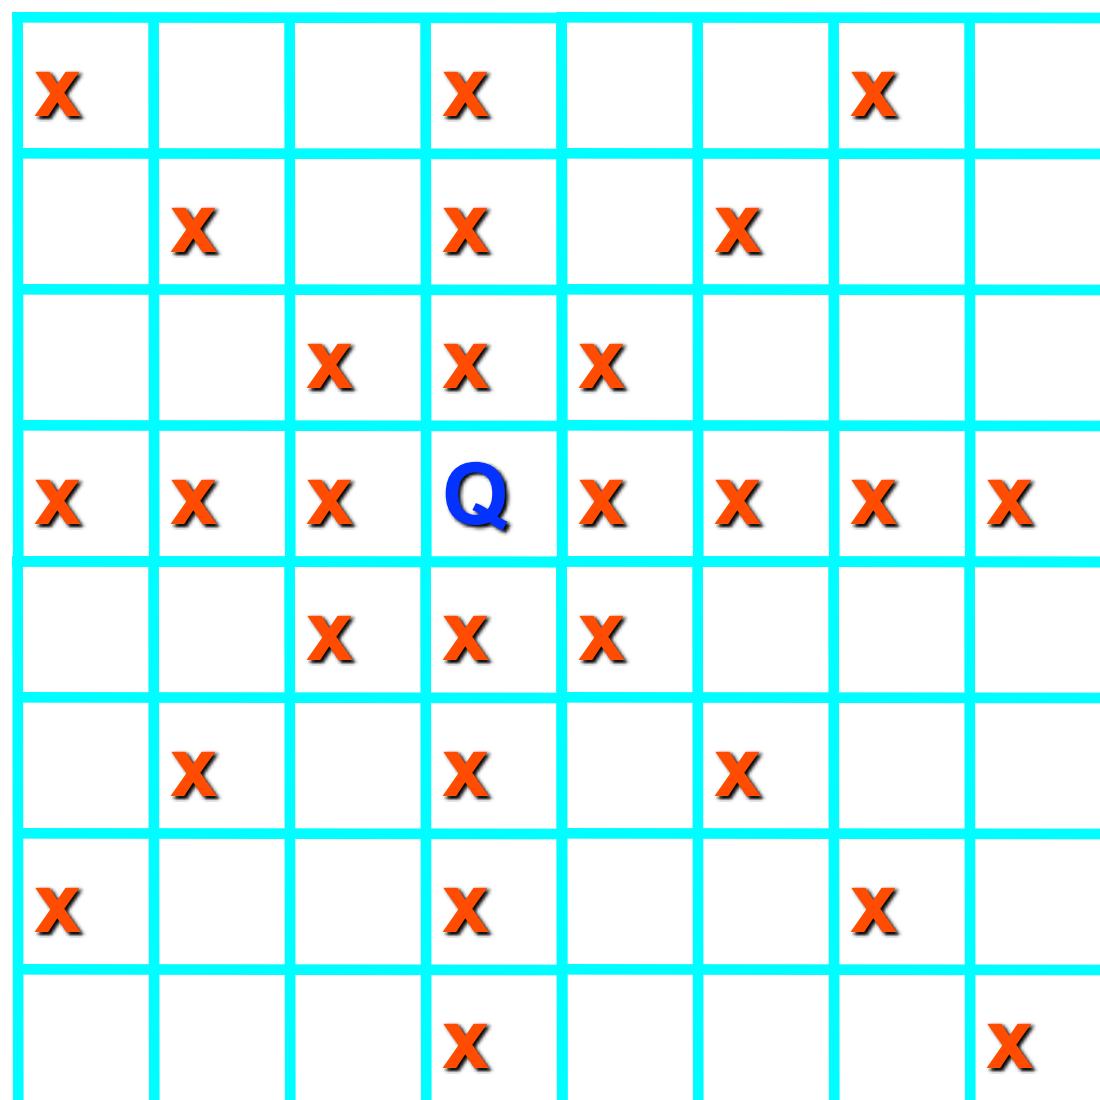

The N-Queens Problem

How can we place n queens on an $n \times n$ chessboard so that no two queens can capture each other?

A queen can move any number of squares horizontally, vertically, and diagonally.

Here, the possible target squares of the queen Q are marked with an X.

Backtracking Solution

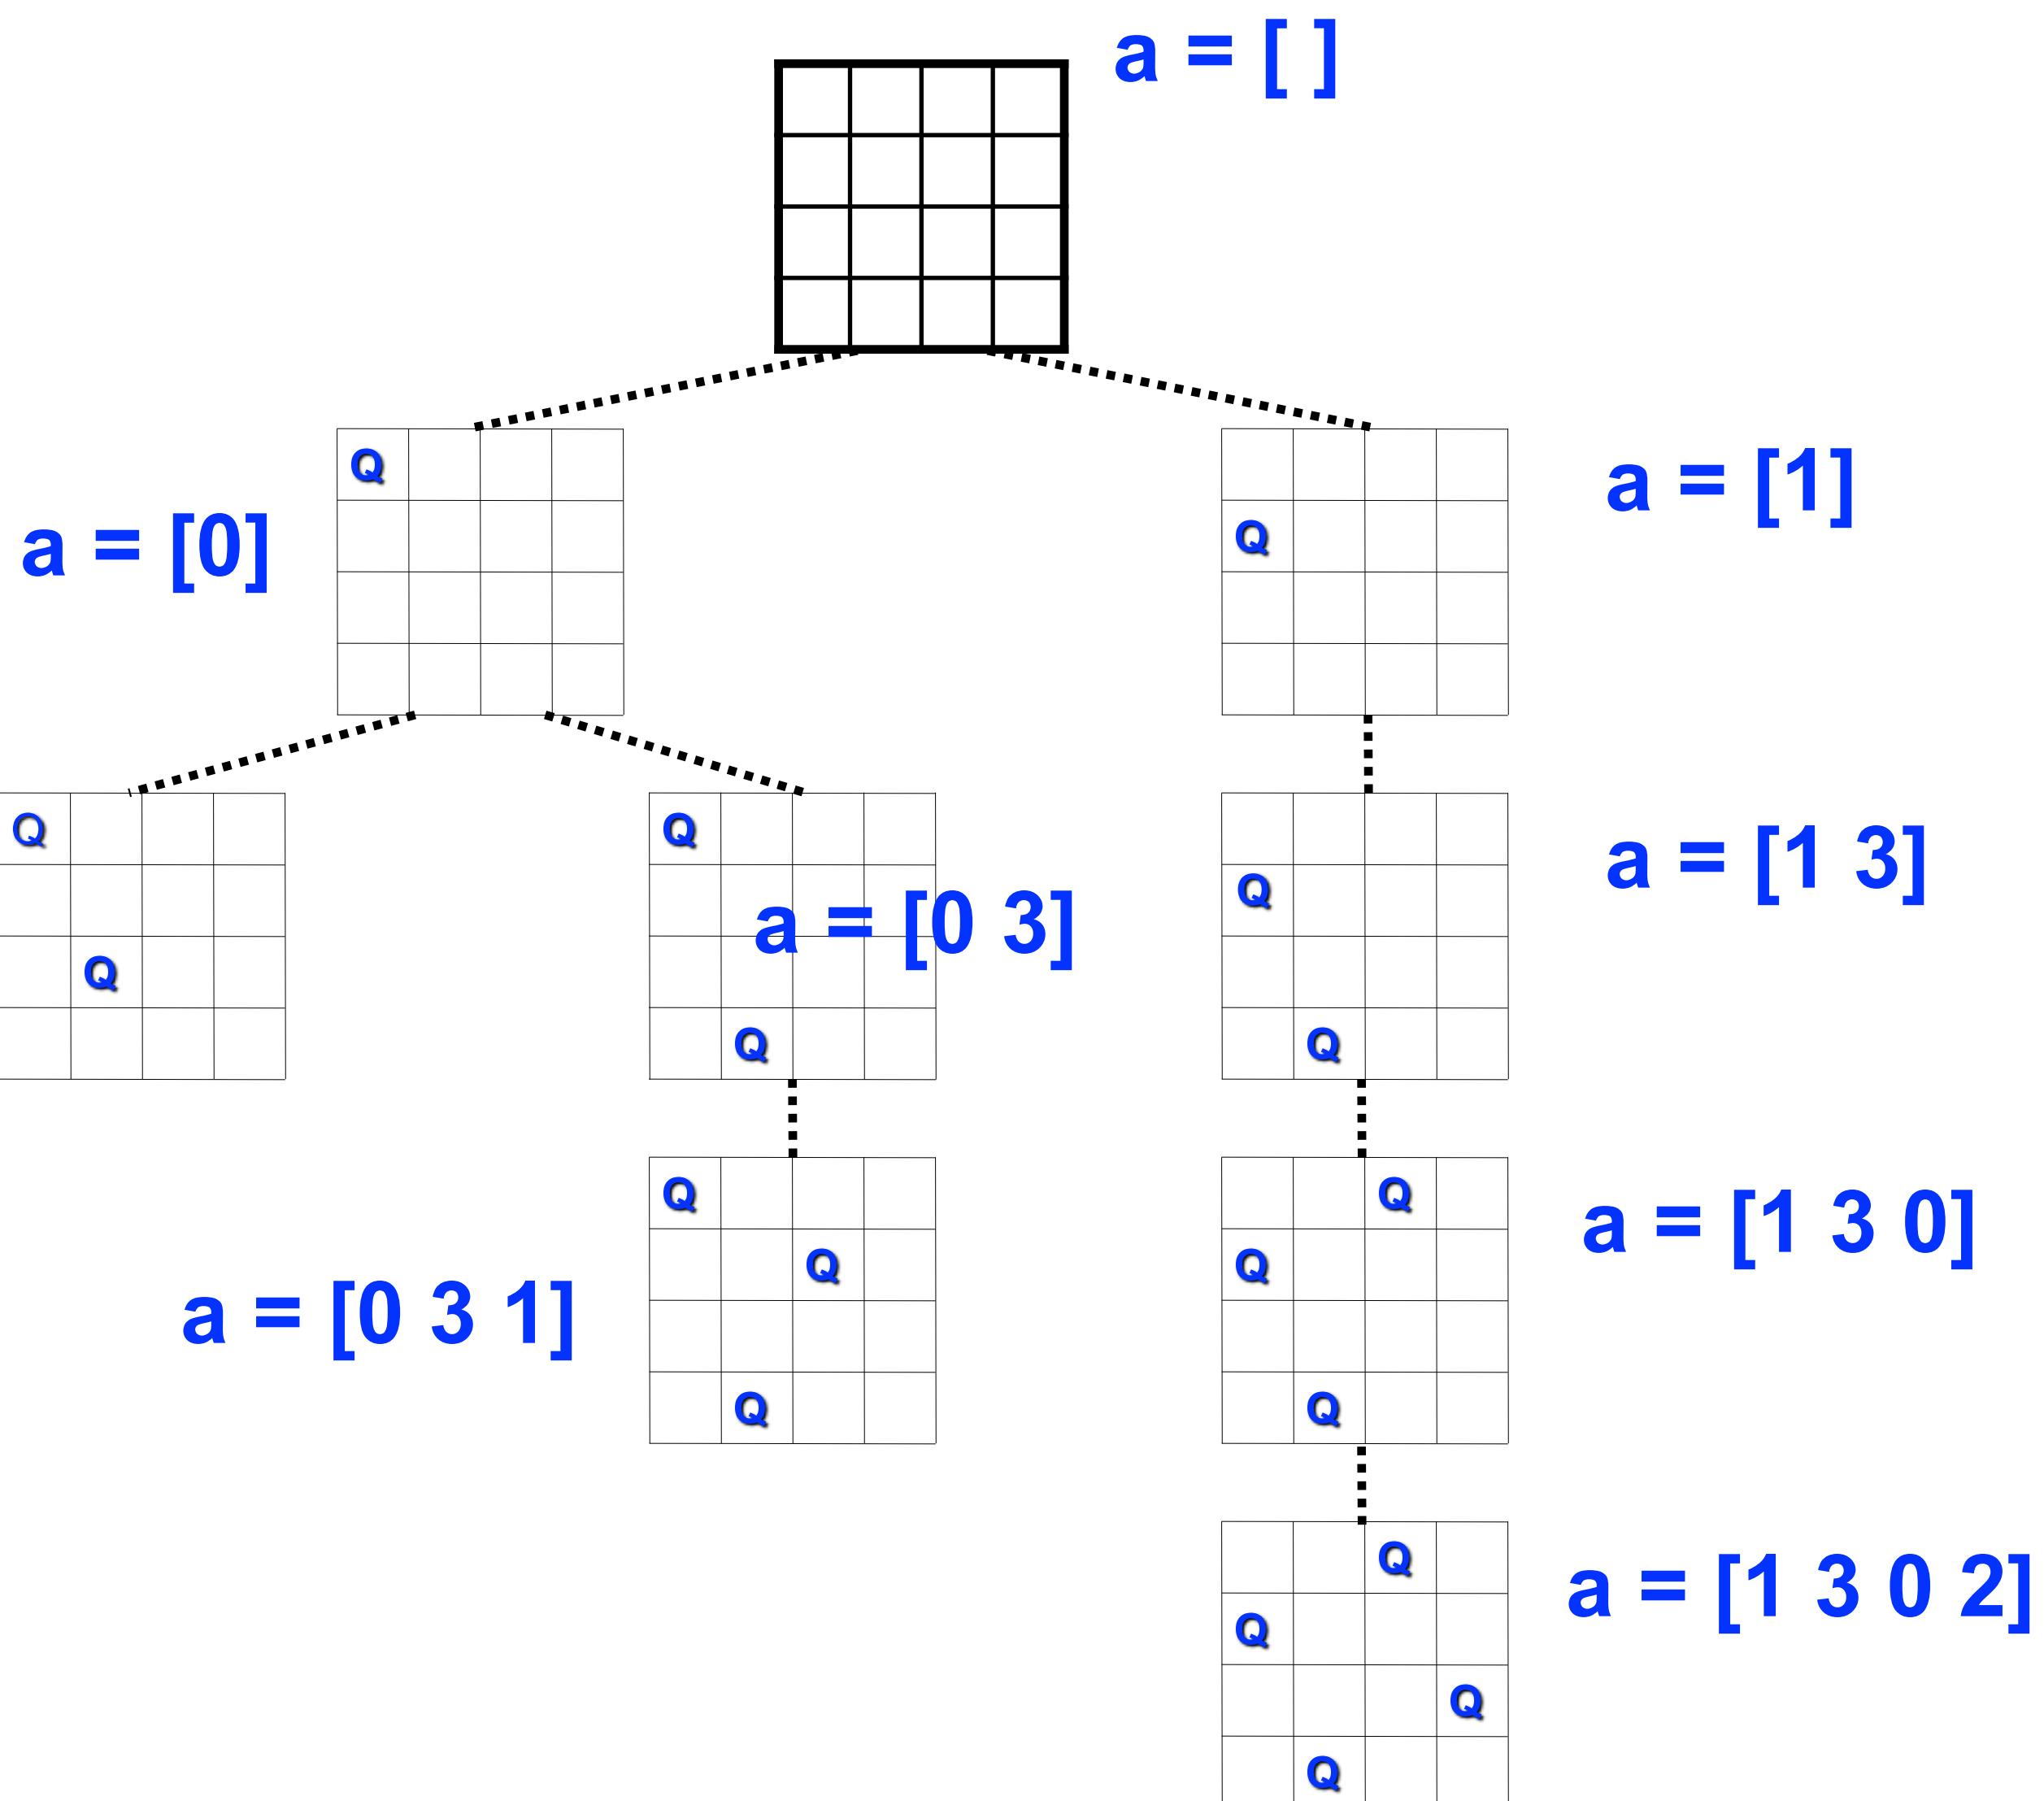

empty board

place 1st queen

place 2nd queen

place 3rd queen

place 4th queen

Sequential solution for NQueens (counting all solutions)

```
1. count = 0;
2. size = 8; nqueens_kernel_seq(new int[0], 0);
3. System.out.println("No. of solutions = " + count);
4. . .
5. void nqueens_kernel_seq(int [] a, int depth) {
6.     if (size == depth) count++;
7.     else
8.         /* try each possible position for queen at depth */
9.         for (int i = 0; i < size; i++) {
10.             /* allocate a temporary array and copy array a into it */
11.             int [] b = new int [depth+1];
12.             System.arraycopy(a, 0, b, 0, depth);
13.             b[depth] = i; // Try to place queen in row i of column depth
14.             if (ok(depth,b)) // check if placement is okay
15.                 nqueens_kernel_seq(b, depth+1);
16.         } // for
17. } // nqueens_kernel_seq()
```

How to extend sequential solution to obtain a parallel solution?

```
1. count = 0;  
2. size = 8; finish nqueens_kernel_par(new int[0], 0);  
3. System.out.println("No. of solutions = " + count);  
4. . . .  
5. void nqueens_kernel_par(int [] a, int depth) {  
6.     if (size == depth) count++;  
7.     else  
8.         /* try each possible position for queen at depth */  
9.         for (int i = 0; i < size; i++) async {  
10.             /* allocate a temporary array and copy array a into it */  
11.             int [] b = new int [depth+1];  
12.             System.arraycopy(a, 0, b, 0, depth);  
13.             b[depth] = i; // Try to place queen in row i of column depth  
14.             if (ok(depth,b)) // check if placement is okay  
15.                 nqueens_kernel_par(b, depth+1);  
16.         } // for  
17. } // nqueens_kernel_par()
```

How to extend sequential solution to obtain a parallel solution?

```
1. FinishAccumulator ac = newFinishAccumulator(Operator.SUM, int.class);
2. size = 8; finish(ac) nqueens_kernel_par(new int[0], 0);
3. System.out.println("No. of solutions = " + ac.get().intValue());
4. . .
5. void nqueens_kernel_par(int [] a, int depth) {
6.     if (size == depth) ac.put(1);
7.     else
8.         /* try each possible position for queen at depth */
9.         for (int i = 0; i < size; i++) async {
10.             /* allocate a temporary array and copy array a into it */
11.             int [] b = new int [depth+1];
12.             System.arraycopy(a, 0, b, 0, depth);
13.             b[depth] = i; // Try to place queen in row i of column depth
14.             if (ok(depth,b)) // check if placement is okay
15.                 nqueens_kernel_par(b, depth+1);
16.         } // for-async
17. } // nqueens_kernel_par()
```

Efficient Parallelism

```
1. FinishAccumulator ac = newFinishAccumulator(Operator.SUM, int.class);
2. size = 8; finish(ac) nqueens_kernel_par(new int[0], 0);
3. System.out.println("No. of solutions = " + ac.get().intValue());
4. . .
5. void nqueens_kernel_par(int [] a, int depth) {
6.     if (size == depth) ac.put(1);
7.     else
8.         /* try each possible position for queen at depth */
9.         for (int i = 0; i < size; i++) async {
10.             /* allocate a temporary array and copy array a into it */
11.             int [] b = new int [depth+1];
12.             System.arraycopy(a, 0, b, 0, depth);
13.             b[depth] = i; // Try to place queen in row i of column depth
14.             if (ok(depth,b)) // check if placement is okay
15.                 nqueens_kernel_par(b, depth+1);
16.         } // for-async
17. } // nqueens_kernel_par()
```

When depth is close to size, the
async tasks get too small

Efficient Parallelism

```
1. FinishAccumulator ac = newFinishAccumulator(Operator.SUM, int.class);  
2. size = 8; finish(ac) nqueens_kernel(new int[0], 0);  
3. System.out.println("No. of solutions = " + ac.get().intValue());  
4. . . .  
5. void nqueens_kernel(int [] a, int depth) {  
6.     if (depth > size - threshold) {  
7.         nqueens_kernel_seq(a, depth)  
8.     } else {  
9.         nqueens_kernel_par(a, depth)  
10.    }  
11. } // nqueens_kernel()
```
