Worksheet #5 solution: Computation Graphs for Async-Finish and Future Constructs

1) Can you write an HJ program with async-finish constructs that generates a Computation Graph with the same ordering constraints as the graph on the right?

No

2) Can you write an HJ program with future async-get constructs that generates a Computation Graph with the same ordering constraints as the graph on the right? If so, provide a sketch of the program.

Yes, see program sketch with void futures. A dummy return value can also be used.

Worksheet #5 solution (contd)

```
1. final HjFuture<Void> A =
2.     future(() -> { return null; });
3. final HjFuture<Void> B =
4.     future(() -> { A.get(); return null; });
5. final HjFuture<Void> C =
6.     future(() -> { A.get(); return null;});
7. final HjFuture<Void> D =
8.     future(() -> { B.get(); C.get(); return null; });
9. final HjFuture<Void> E =
10.    future(() -> {C.get(); return null; });
11. final HjFuture<Void> F =
12.    future(() -> { D.get(); E.get(); return null; });
13. F.get();
```

The N-Queens Problem

How can we place n queens on an $n \times n$ chessboard so that no two queens can capture each other?

A queen can move any number of squares horizontally, vertically, and diagonally.

Here, the possible target squares of the queen Q are marked with an **x**.

Decision Trees

- In any solution of the n -queens problem, there must be exactly one queen in each column of the board.
- Otherwise, the two queens in the same column could capture each other.
- Therefore, we can describe the solution of this problem as a sequence of n decisions:
 - Decision 1: Place a queen in the first column.
 - Decision 2: Place a queen in the second column.
 - .
 - .
 - .
- Decision n : Place a queen in the n -th column.
- Since there are multiple choices for each decision, we get a “decision tree”

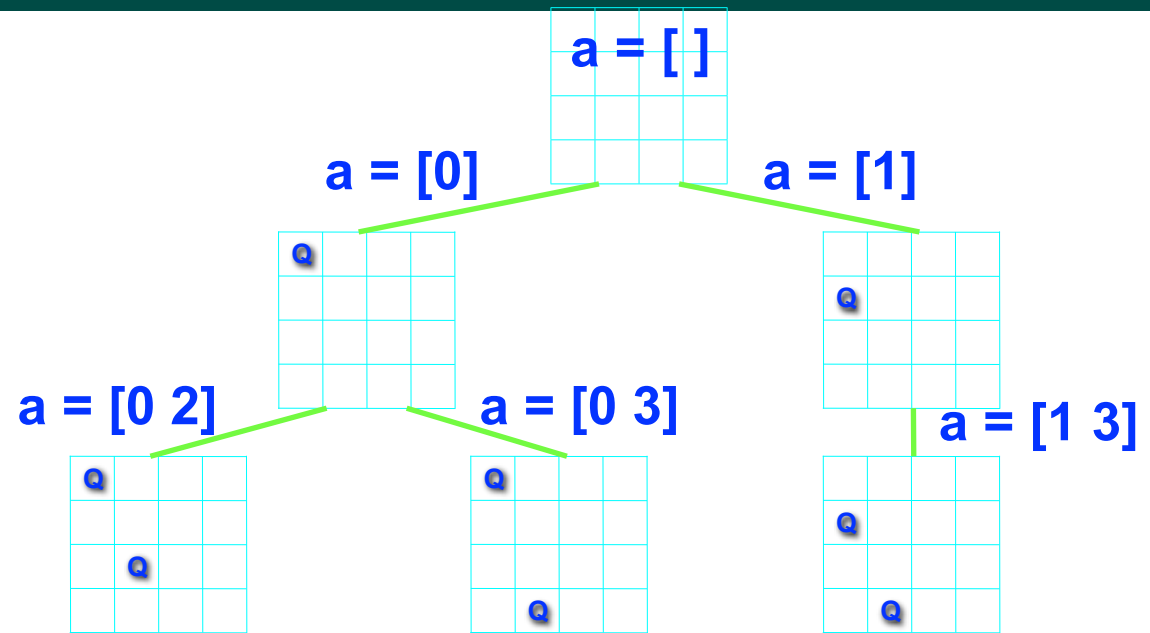

Decision Tree

empty board

place 1st queen

place 2nd queen

Backtracking in Decision Trees

- There are problems that require us to perform an exhaustive search of all possible sequences of decisions in order to find the solution.
- We can solve such problems by constructing the complete decision tree and then find a path from its root to a leaf that corresponds to a solution of the problem
- In many cases, the efficiency of this procedure can be dramatically increased by a technique called backtracking (depth-first search).

Backtracking and Decision Tree states

- Idea: Start at the root of the decision tree and move downwards, that is, make a sequence of decisions, until you either reach a solution or you enter a state from where no solution can be reached by any further sequence of decisions.
- In the latter case, backtrack to the parent of the current state and take a different path downwards from there. If all paths from this state have already been explored, backtrack to its parent.
- Continue this procedure until you find a solution (or all solutions), or establish that no solution exists.
- A state in the decision tree can be encoded as an array, $a[0..c-1]$ for c columns, where $a[i]$ = row position of queen in column i .

Backtracking in Decision Trees

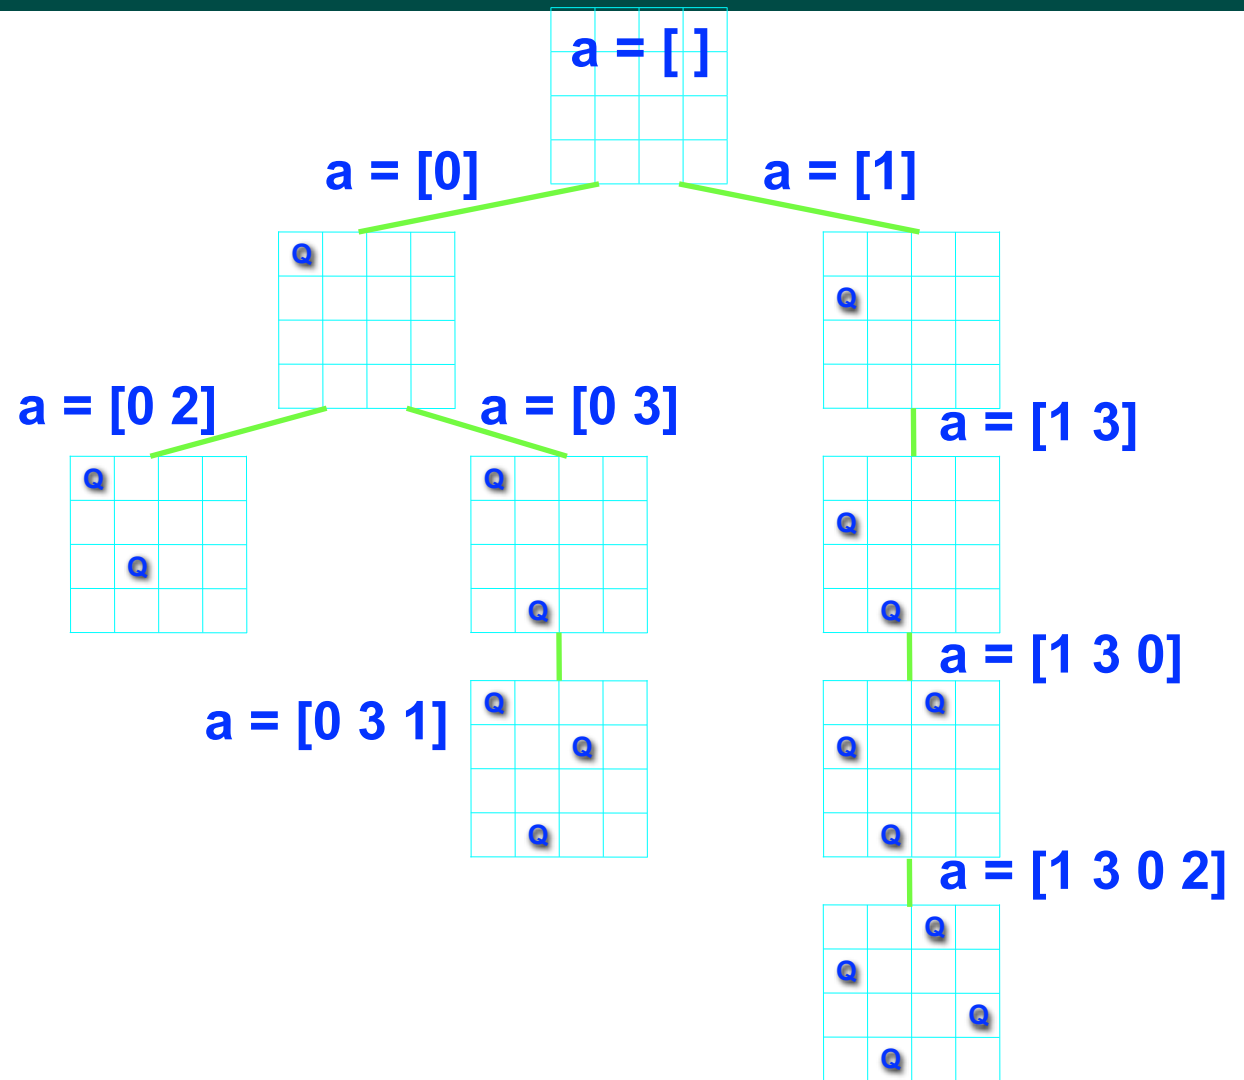

empty board

place 1st queen

place 2nd queen

place 3rd queen

place 4th queen

Sequential solution for NQueens (counting all solutions)

```
1. static int count;
2. . . .
3. count = 0;
4. nqueens_kernel(new int[0], 0);
5. System.out.println("No. of solutions = " + count);
6. . . .
7. void nqueens_kernel(int [] a, int depth) {
8.     if (size == depth) count++;
9.     else
10.        /* try each possible position for queen at depth */
11.        for (int i = 0; i < size; i++) {
12.            /* allocate a temporary array and copy array a into it */
13.            int [] b = new int [depth+1];
14.            System.arraycopy(a, 0, b, 0, depth);
15.            b[depth] = i;
16.            if (ok(depth+1,b)) nqueens_kernel(b, depth+1);
17.        } // for-async
18. } // nqueens_kernel()
```

Parallel Solution to NQueens Problem?

```
1. static accumulator count;
2. . . .
3. count = 0;
4. finish nqueens_kernel(new int[0], 0);
5. System.out.println("No. of solutions = " + count);
6. . . .
7. void nqueens_kernel(int [] a, int depth) {
8.     if (size == depth) count++;
9.     else
10.        /* try each possible position for queen at depth */
11.        for (int i = 0; i < size; i++) async {
12.            /* allocate a temporary array and copy array a into it */
13.            int [] b = new int [depth+1];
14.            System.arraycopy(a, 0, b, 0, depth);
15.            b[depth] = i;
16.            if (ok(depth+1,b)) nqueens_kernel(b, depth+1);
17.        } // for-async
18. } // nqueens_kernel()
```

Parallel NQueens Example

```
1. // Challenge: how to count number of solutions found?
2.
3. finish nqueens_kernel(new int[0], 0);
4. System.out.println("No. of solutions = " + ...);
5. . . .
6. void nqueens_kernel(int [] a, int depth) {
7.     if (size == depth) // solution found: how to count?
8.     else
9.         /* try each possible position for queen at depth */
10.        for (int i = 0; i < size; i++) async {
11.            /* allocate a temporary array and copy array a into it */
12.            int [] b = new int [depth+1];
13.            System.arraycopy(a, 0, b, 0, depth);
14.            b[depth] = i;
15.            if (ok(depth+1,b)) nqueens_kernel(b, depth+1);
16.        } // for-async
17. } // nqueens_kernel()
```

Finish Accumulators in HJ (Pseudocode)

- **Creation**

```
accumulator ac = newFinishAccumulator(operator, type);
```

- operator can be `Operator.SUM`, `Operator.PROD`, `Operator.MIN`, `Operator.MAX` or `Operator.CUSTOM`
- type can be `int.class` or `double.class` for standard operators or any object that implements a "reducible" interface for `CUSTOM`

- **Registration**

```
finish (ac1, ac2, ...) { ... }
```

- Accumulators `ac1`, `ac2`, ... are registered with the finish scope

- **Accumulation**

```
ac.put(data);
```

- can be performed by any statement in finish scope that registers `ac`

- **Retrieval**

```
ac.get();
```

- `get()` is nonblocking because finish provides the necessary synchronization
Either returns initial value before end-finish or final value after end-finish
- result from `get()` will be deterministic if `CUSTOM` operator is associative and commutative

Error Conditions with Finish Accumulators

1. Non-owner task cannot access accumulators outside registered finish

```
// T1 allocates accumulator a
accumulator a = newFinishAccumulator(...);
async { // T2 cannot access a
    a.put(1); Number v1 = a.get();
}
```

2. Non-owner task cannot register accumulators with a finish

```
// T1 allocates accumulator a
accumulator a = newFinishAccumulator(...);
async {
    // T2 cannot register a with finish
    finish (a) { async a.put(1); }
}
```

Use of Finish Accumulators to count solutions in Parallel NQueens

```
1. final FinishAccumulator ac =
2.     newFinishAccumulator(Operator.SUM, int.class);
3. finish\(ac\) nqueens_kernel(new int[0], 0);
4. System.out.println("No. of solutions = " + ac.get\(\).intValue\(\))
5. . . .
6. void nqueens_kernel(int [] a, int depth) {
7.     if (size == depth) ac.put\(1\);
8.     else
9.         /* try each possible position for queen at depth */
10.        for (int i = 0; i < size; i++) async {
11.            /* allocate a temporary array and copy array a into it */
12.            int [] b = new int [depth+1];
13.            System.arraycopy(a, 0, b, 0, depth);
14.            b[depth] = i;
15.            if (ok(depth+1,b)) nqueens_kernel(b, depth+1);
16.        } // for-async
17. } // nqueens_kernel()
```

Course Announcements

- **Homework 1 is due on Jan 31st**
 - 10% per day penalty for late submissions
- **Course grading rubric (see course wiki for details)**
 - Six homeworks = 40% total (6.67% per homework)
 - Exam 1 = 20% (Take home, assigned Feb 26th, due by Feb 28th)
 - Exam 2 = 20% (Take home, assigned April 25th, due by May 2nd)
 - edX quizzes = 10% total
 - Class participation = 10% total (labs, worksheets, in-class Q&A, Piazza Q&A, bug reports, demonstration volunteers, ...)
