Station 2: Convert DVD to Digital Files

1. Insert your DVD into the Sony Buffalo DVD drive. The movie may begin to play; just pause and quit the DVD player.

2. Open HandBrake . A window appears allowing you to select the disk you previously inserted. If it does not, click the Source button

Source on the top left of the screen, select your disc and click open.

3. HandBrake will open and scan the disc. Once the scan is complete, HandBrake menu will load. Handbrake chooses what it thinks is the main title,

but you can click the pop-up menu next to Title: 1-00h41m16s and choose the item you and choose the item you want to encode. Generally speaking, the title with the longest duration is the DVD's main feature. If the disc content has been broken up into more

than one section here and you want to convert all the items, click the *Add To Queue* Add to Queue button, and then repeat the process for each item until you've added them all to the encoding queue. You might even find it easier to choose *File > Add All Titles To Queue*, which as you might expect adds everything to the queue. From there you can delete any title that you don't want to rip by clicking the *X* to the right of each title's name. If you want to make sure you've chosen the right title before you start encoding, pick the one you think you want, then click the *Preview*

Window Preview Window button and a new window opens up. From there you can scroll through ten still images from the title or, if that's not good enough, choose to encode and watch 15 to 240 seconds of the title.

- 4. If you encounter problems such as "HandBrake quitting or crashing when it scans your DVD", or a "DVD with 99 titles of almost the same length", you've run into copy-protected DVD. In that case, launch Apple's DVD Player application, and navigate through the warnings, ads, and previews until you're playing the main feature. Then choose Go > Title from the menu bar, and find the title with a chek mark next to it. In HandBrake choose File > Open Source (Title Specific), select your DVD, and enter that title number in the box and click Open Title.
- 5. Choose your encoding settings based on the device(s) on which you plan to view the content. If the Presets Drawer isn't already open, click the To ggle Presets button at the top of the HandBrake window. If you just want to rip the DVD to have digital files, then Regular Normal preset should be fine.

- 6. If your movie is in a foreign language, or you have a hearing impairment and need to read the closed captions when you watch, HandBrake's Subtitles tab is the place to look. There you can find whatever subtitle or captioning data comes on your DVD and decide which to include in your ripped file. Typically, subtitles must be *burned* into your file, meaning you can't turn them on or off, whereas closed captioning data is added as a separate text track that you can choose while watching in QuickTime.
- 7. Click Browse next the File Destination

File:	/Volumes/SAVEWORKHERE/My DVD.m4v		Browse	, you can rename the file by
chan	ging the name in the box next to Save As (shown in the yellow box below) here. Then sele	ect y	our USB	or however you plan to save the file.
If you	need to temporarily store it here, select SAVE WORK HERE.			

		Format 🗸 MP4 file	
8.	Be sure the output format is MP4 file	MKV file	; the codec is set to H.264
	Video Codec: 🗸 H.264 (x264)		
	Video Quality MPEG-2 (FFmpeg MPEG-2 (FFmpeg)) :: the framerate is same as source	Framerate (FPS): Same as source \$

9. Click on Picture Settings, make sure the height and width look right to your output. We recommend you to have it the same as the original frame size.

- 10. Click the green start button on the top left screen Start. The disc will begin to digitize.
- 11. Be sure to remove your disc from the drive once you are finished.
