Biophysical models of specificity.

[DNA targeting specificity of RNA-guided Cas9 nucleases \(https://crispr.bme.gatech.edu/\)](https://crispr.bme.gatech.edu/): Contains experimental data about the specificity. They also have a server based on the data.

[A Biophysical Model of CRISPR/Cas9 Activity for Rational Design of Genome Editing and Gene Regulation](#): This is a simple biophysical model used to predict the specificity of the sgRNA based on the sequence. They split the process in 3 steps and add the free energy change of each process to calculate a binding energy.

[High-fidelity CRISPR–Cas9 nucleases with no detectable genome-wide off-target effects](#) : Mutations on residues that bind to the phosphate backbone of the DNA can improve the specificity.

Cleavage

QM:MM Simulations

Gamess+Tinker http://cfm.ehu.es/ricardo/master/intranet_ESCMAN/WinGAMESS/manuals/simomm.pdf (advantages: free, disadvantages: might not run well)

Gaussian+Gromacs http://www.gromacs.org/Downloads/Installation_Instructions/compiling_QMMM (advantages: will work well, Scuseria will likely help; disadvantages: will likely be limited to Rice U comp. resources.)

[Mechanistic Insight into Catalytic Activity of BBA-Metallonucleases](#) (This model system, *Vibrio vulnificus*, is thought to have the same cleavage mechanism as the HNH domain.)

[Catalytic Mechanisms of Restriction and Homing Endonucleases](#) (A general overview of both one- and two-metal reactions, not specifically theory-oriented.)

[The Nucleophile in Ribozyme Catalysis](#) (Not directly related, but an analogous cleavage reaction. The SI also has lots of detailed information on their QM/MM simulations.)
