

Split by Attributes

Split by Attributes

Split by Attributes allows you to turn features such as contour lines to split into a set of features. This can be helpful if you need to export the data to AutoCAD.

1. In the **Analysis** tab, click the **Tools** and search for **Split by Attributes**.
2. From the "Input Table" drop-down menu, select your desired **feature** to split. Click the **folder icon** next to "Target Workspace" to save the result to your **geodatabasefolder**.
3. Under "Split Fields", check the name of the attribute table field according to which you want the feature to split. Click **OK**.
4. Navigate to your geodatabase in the **Catalog** pane and drag the new features into your map.
